E. *sickle*): see *secant, section*.] **1.** A cutting-tool consisting of a metal blade, band, or plate with the edge armed with cutting teeth, worked either by a reciprocating movement, as in a hand-saw, or by a continuous motion in one direction, as in a circular saw, a band-saw, and an annular saw. Saws are for the most part made of tempered steel. The teeth of the smaller kinds are formed by cutting or punching in the plate interdental spaces or gullets. In saws of large size inserted or removable teeth are now much used. Small saws are generally provided with a single handle of hard wood; larger saws, for use by two workmen, have a handle at each end. Reciprocating saws more generally have their teeth inclined toward the direction of their cutting-stroke (see *rake*[3], *n.*, 1), but some cut in both directions equally. To cut freely, saws must have, for most purposes, what is called *set*—that is, alternate teeth must be made to project somewhat laterally and uniformly from opposite sides of the saw in order that the kerf or saw-cut may be somewhat wider than the thickness of the saw-blade. This prevents undue friction of the sides of the blade against the sides of the kerf. Some saws, however, as surgeons' saws, hack-saws, etc., have little or no set, and undue friction against the kerf is prevented by making the blades of gradually decreasing thickness from the edge toward the back.

a, circular saw (right-hand and left-hand saws have the teeth running in opposite directions); *b*, section of circular saw showing flange at *c*; *d*, concave saw; *e*, circular saw with inserted teeth; *f*, mill-saw; *g*, ice-saw; *h*, cross-cut saw; *i*, band-saw; *j*, rip-saw; *k*, hand-saw; *l*, panel-saw; *m*, pruning-saw; *n*, whip-saw; *o*, wood-saw; *p*, keyhole- or compass-saw; *q*, back-saw; *r*, bow-back butchers'-saw.

A saw-blade together with the handles or frame to which the blade is attached, as a hand-saw, wood-saw, or hack-saw.—**3.** In *zoöl.* and *compar. anat.*, a serrated formation or organ, or a serrated arrangement of parts of formations or organs. (*a*) The set of teeth of a merganser, as *Mergus serrator*. (*b*) The serrate tomial edges of the beak of any bird. See *sawbill, serratirostrate*. (*c*) The long flat serrate or dentate snout of the saw-fish. See cut under *Pristis*. (*d*) The ovipositor of a saw-fly (*Tenthredinidæ*).

4. A sawing-machine, as a scroll-saw or jig-saw.—**5.** The act of sawing or see-sawing; specifically, in *whist* [U. S.], same as *see-saw*, 3 (*b*).—**Annular saw.** (*a*) A saw having the form of a hollow cylinder or tube, with teeth formed on the end, and projecting parallel to the longitudinal axis of the cylinder, around which axis the saw is rotated when in use. Also called *barrel-saw, crown-saw, cylinder-saw, drum-saw, ring-saw, spherical saw*, and *tub-saw*. See cut under *crown-saw*. (*b*) In *surg.*, a trephine.—**Brier-tooth saw,** a saw gulleted deeply between the teeth, the gullets being shaped in a manner which gives the teeth a curvature resembling somewhat the prickles of briers (whence the name). This form of tooth is chiefly used in circular saws, rarely or never in reciprocating saws. Also called *gullet-saw*.—**Butcher's saw** [named after R. G. *Butcher*, a Dublin surgeon], a narrow-bladed saw set in a frame so that it can be fastened at any angle: used in resections.—**Circular saw,** a saw made of a circular plate or disk with a toothed edge, either formed integrally with the plate, or made by inserting removable teeth, the latter being now the most approved method for teeth of large lumber-cutting saws. Circular saws are very extensively used for manufacturing lumber, and their cutting power is enormous, some of them being over 7 feet in diameter, running with a circumferential velocity of 9,000 feet and cutting at the rate of 200 feet of kerf per minute. From the nature of this class of saws, they are exclusively used in sawing-machines. These machines, for small saws, are often driven by foot- or hand-power, but more generally by steam-, water-, or animal-power. Plain circular saws can cut only rectilinear kerfs, but some circular saws have a dished or concavo-convex form, by which curved shapes corresponding with the shape of the saw may be cut. See cut under *rim-saw*.—**Comb-cutters' saw.** Same as *comb-saw*.—**Cross-cut saw.** (*a*) A saw adapted by its filing and setting to cut across the grain. The teeth are filed to act more nearly like knife-points than those of rip-saws, which act more like chisels. Cross-cut saws have a wider set than rip-saws. (*b*) Particularly, a saw used by lumbermen for cutting logs from tree-trunks, having an edge slightly convex in the cutting-plane, a handle at each end projecting from and at right angles with the back in the plane of the blade, and teeth filed so that the saw cuts when drawn in either direction. It is operated by two workmen, one at each handle.—**Double saw,** two parallel saw-blades working together at a specific distance from each other, and in cutting leaving a piece of specific thickness between their kerfs.—**Endless saw.** Same as *band-saw*.—**Equalizing saw,** a pair of circular saws placed on a mandrel and set at any desired distance apart by a gage: used for squaring off the ends of boards, etc.—**Hack-saw,** a small stout frame-saw with little set, close teeth, and well tempered: used for sawing metal, as in cutting off bolts, nicking heads of hand-made screws, etc.—**Half-back saw,** a hand-saw the back of which is stiffened to a distance of half the length of the blade from the handle.—**Half-rip saw,** a hand-saw without a back, and having a width of set intermediate between that of a cross-cut saw and that of a rip-saw.—**Hey's saw,** a small two-edged saw set in a short handle: one edge is straight, the other convex. It is used in removing pieces of bone from the skull.—**Interosseous saw.** See *interosseous*.—**Perforated saw,** a saw having a series of perforations behind the teeth.—**Pitch of a saw.** See *pitch*[1].—**Pit frame-saw,** a double frame-saw, worked by hand, to the frame of which are attached upper and lower cross-handles analogous to those used on the ordinary pit-saw.—**Railway cut-off saw,** a circular saw or buzz-saw supported on its frame upon a carriage moving on a track, so that it can be fed backward and forward to its work.—**Reversible saw,** a straight-edged saw having both edges armed with teeth, so that cutting can be done with either edge, at will, by reversing the saw.—**Smith's saw,** a hack-saw.—**To be held at the long saw**†, to be kept in suspense.

Between the one and the other he was *held at the long saw* above a month.

The main features of the apparatus are a guiding-frame for holding the saw during the operation of jointing, which moves upon adjustable ways in such manner as to gage the filing of the teeth so that their points will lie in the arc of a circle of considerable radius. Saxifraga (sak-sif′rā-gä), *n.* [NL. (Tournefort, 1700): see *saxifrage.*] A genus of dicotyledonous choripetalous plants popularly known as *saxifrage,* type of the family *Saxifragaceæ* and tribe *Saxifrageæ.* It is characterized by a two-celled ovary maturing into a small two-beaked and two-celled many-seeded pod, with the placentæ in the axis, and by flowers with a five-lobed calyx, five equal petals, and ten stamens, with slender filaments and two-celled anthers. There are about 180 species, chiefly natives of cold regions, especially high mountains and in arctic latitudes, chiefly of the northern hemisphere, rare in South America and in Asia. They are usually perennials, with a radical rosette of broad leaves, and varying in habit from erect to prostrate, and from very smooth to glandular-hairy. Their flowers are small, but of conspicuous numbers, usually white or yellow, and panicled or corymbed. There are about 210 species, of which 67 occur in North America exclusive of Mexico. They increase rapidly northward, and 25 or more are reported from Alaska, 9 of which extend to its most northern limit, Point Barrow, at 71° 27′. *S. oppositifolia,* the purple saxifrage, is perhaps the most characteristic and widely distributed plant of the arctic regions, where it is almost universal, and often the first flower to bloom, producing from four to nine pink or dark-purple petals, ranging from sea-level to 1,900 feet, and extending from northern Vermont to latitude 83° 24′. See *saxifrage.*

Most *Saxifrages* make stolons and offshoots freely, and by these the plants are easily propagated; they are also increased by division. *Bailey,* Cyclo. of Hort., IV. 1618.

Saxifragaceæ (sak″si-frā-gā′sē-ē), *n. pl.* [NL. (A. P. de Candolle, 1805), < *Saxifraga* + *-aceæ.*] A family of dicotyledonous plants, the saxifrage family, belonging to the order *Rosales.* It is closely allied to the *Rosaceæ,* but with usually only five or ten stamens, and is characterized by the usual presence of regular flowers with five sepals, five petals, free and smooth filaments, two-celled anthers, a swollen or divided disk, and an ovary of two carpels, often separate above and containing numerous ovules in two rows at the central angle. In Engler's system it includes about 600 species in 75 genera; but here the *Hydrangeaceæ, Escalloniaceæ,* and *Grossulariaceæ* are included, mostly as subfamilies. It exhibits great variety in habit. In the shrubby genera and trees the leaves are generally opposite; in the others alternate, and often chiefly radical. Many produce valued fruits, as the currant and gooseberry; in others the fruit is a dry capsule. Many are cultivated for their ornamental flowers. See *Heuchera* and *Saxifraga* (the type of the family); also *Francoa, Mitella, Parnassia,* and *Tiarella.*

Flowering Plant of Saxifrage (*Saxifraga Virginiensis*). *a*, a flower; *b*, the fruit.

Scarcely any of the species have economic properties, but many are beautiful in foliage and flower. They are commonly rock-plants with tufted leaves and panicles of white, yellow, or red flowers. They are predominantly alpine, and of alpine plants they are the most easy to cultivate. One group, as *S. hypnoides,* has mossy foliage, forming a carpet, in spring dotted with white flowers. Others, as *S. Aizoon,* have the foliage silvery, in rosettes. Others, as *S. umbrosa,* the London-pride or none-so-pretty, and *S. oppositifolia,* the purple saxifrage, afford brilliant colored flowers. A leathery-leafed group is represented by the Siberian *S. crassifolia,* well known in cultivation. A common house-plant is *S. sarmentosa,* the beefsteak- or strawberry-geranium (see *geranium*), also called *sailor-plant, creeping-sailor,* and *Chinese saxifrage. S. Virginiensis* is a common spring flower in eastern North America.—**Burnet-saxifrage,** a common Old World plant, *Pimpinella Saxifraga,* with leaves resembling those of the garden burnet. The few relics left us of this style exhibit its general characteristics as rude solidity and strength. The walls are of rough masonry, very thick, without buttresses, and sometimes of herring-bone work; the towers and pillars are thick in proportion to height, the former being sometimes not more than three diameters high; the quoins or angle-masonry are of hewn stones set alternately on end and horizontally (long and short work); the arches of doorways and windows are rounded, or sometimes these openings have triangular heads, their jambs of long and short work carrying either rudely carved imposts or capitals with square abaci. Sometimes heavy moldings run round the arches, and when two or more arches are conjoined in an arcade they are carried on heavy low shafts formed like balusters. Window-openings in the walls splay from both the interior and the exterior, the position of the windows being in the middle of the thickness of the wall.—**Saxon blue.** (*a*) Same as *Saxony blue* (which see, under *blue*). What *say* you *to* a letter from your friends?
Shak., T. G. of V., ii. 4. 51.

=Syn. *Say, Speak, Tell, State.* Each of these words has its peculiar idiomatic uses. We *speak* an oration, and *tell* a story, but do not *say* either of them. We *say* prayers or a lesson, but do not *speak* or *tell* them, although the one praying may *tell* his beads. *Say* is the most common word before a quotation direct or indirect: Adam *said*, "This is now bone of my bones" (Gen. ii. 23); "If we *say* that we have no sin, we deceive ourselves" (1 John i. 8). *Tell* is often exactly synonymous with *say to:* as, *tell* (*say to*) him that I was called away. *Speak* draws its meanings from the idea of making audible; *tell*, from that of communicating. *Tell* is the only one of these words that may express a command. *State* is often erroneously used for simply *saying:* as, he *stated* that he could not come: *state* always implies detail, as of reasons, particulars; to *state* a case is to give it with particularity.

scagliola (skäl-yō′lä), *n.* [Also *scaliola;* < It. *scagliuola,* dim. of *scaglia,* a scale: see *scale*[1].] In *arch.,* an Italian process for imitating stone, used for enriching columns and internal walls of buildings. It is an application of stucco consisting essentially of a mixture of plaster with glue. The plaster employed must be as pure and white as possible. Various colors are given to it by a mixture of metallic oxids. To

imitate different kinds of marble, the colors are mixed with the paste. Breccias are imitated by introducing fragments of colored stucco; granites and porphyries in the same way, and also by cutting into the stucco and filling the cavities with a paste having the color of the crystals it is desired to imitate. Sometimes the stucco is put upon the wall with a brush, as many as twenty coats being applied. It is then roughly polished, and the cavities and defective places filled up; and this is done over and over, until the surface has attained the desired perfection; a finer polish is then given.

So was [thrown open] the double door of the entrance-hall, letting in the warm light on the *scagliola* pillars, the marble statues, and the broad stone staircase, with its matting worn into large holes. *George Eliot*, Felix Holt, i.

It terminates at both apex and base in a blind pointed extremity, but is continuous through the canalis reuniens, near its basal extremity, with the saccule of the vestibule. Also called *canalis membranaceus* and *cochlear duct* or *canal of the cochlea*; the latter two terms, however, are sometimes restricted to mean respectively the passage between the tectorial membrane and the basilar membrane and the one between the tectorial membrane and the membrane of Reissner.—**Scala tympani**, that part of the spiral canal of the cochlea which is on the under side of the spiral lamina, and is separated from the scala media by the basilar membrane. Cf. *scalary*.] **I**, *n.* In quaternions, a real number, positive or negative, integral, fractional, or surd: but some writers lately extend the meaning so as to include imaginaries. Sir W. R. Hamilton introduced the word with the meaning "a real number"; and it tends to confuse the subject to use a word needed for one purpose to signify something else for which no new word is needed.—**Scalar of a quaternion**, a scalar which, being subtracted from the quaternion, leaves a vector as the remainder.

They are marine shells, mostly of warm temperate and tropical seas, turreted and costate, or with many raised cross-ribs at intervals along the whorls. The most celebrated species is *S. pretiosa*, formerly considered rare and bringing a large price. Also *Scala*, *Scalia*, *Scalarius*, *Scalarus*.

These ridges, or alternating thick and thin places, follow each other with as much regularity as the rounds of a ladder.

2. In *conch.*, resembling or related to *Scalaria*; scalarian.—**Scalariform conjugation**, in fresh-water algæ, conjugation between several cells of two different filaments, when the two lie very near one another side by side. Each cell of each filament sends out a short protuberance on the side facing the other filament. When these protuberances meet, the cell-wall becomes absorbed at the extremity of each, and an open tube is thus formed. It is the ordinary mode of conjugation in the *Mesocarpaceæ*.—**Scalariform vessels**, vessels in which the walls are thickened in a scalariform manner. They are especially abundant in ferns.

Also applied in the *Coniferæ* to the leaves or bracts of the cone, and to the chaff on the stems of ferns. See also cuts under *imbricate* and *rosin-plant.*—**3.** In *zoöl.*, an epidermal or exoskeletal structure that is thin, flat, hard or dry, and of some definite extent; a piece of cuticle that is squamous, scaly, or horny, and does not constitute a hair, a feather, or a horn, hoof, nail, or claw; a squama; a scute; a scutellum. All these structures, however, belong to one class, and there is no absolute distinction. Scales are often of large size and great comparative thickness or solidity, and may be reinforced by bone, in which case they are commonly called *shields* or *plates.* Specifically—(*a*) In *ichth.*, one of the particular modifications of epidermis which collectively form the usual covering, more or less complete, of fishes; a fish-scale. They are of many forms and sizes, but have been sometimes considered under the four heads of *cycloid, ctenoid, ganoid,* and *placoid,* and fishes have been classified accordingly, as by Agassiz. (See *cycloid,* etc.) They are developed on the inner side of the general epidermis, but vary greatly in form and other characteristics. In most living fishes they are expanded horny lamellæ, and imbricated, the posterior edges of one transverse row overlapping adjacent parts of the succeeding row. Growth takes place from a central, subcentral, or posterior nucleus by increase at the periphery. Generally the anterior part, or base of insertion, is provided with striæ or grooves diverging backward. (1) In numerous fishes growth takes place in layers and at the posterior edges as much as at the anterior, and there are no teeth or denticles at the posterior margin: such are called *cycloid* scales. (2) When the posterior margin is beset with denticles, a *ctenoid* scale is the result. When vestiges of such teeth or denticles are retained on the surface between the nucleus and the posterior margin, the surface is to that extent *muricated.* In other forms the growth is almost entirely sideways and forward, and the nucleus is consequently near the posterior edge. (3) Still other fishes have a hard enameled surface to the scale, which is generally of a rhomboidal form, and such a scale is called *ganoid;* but few modern fishes are thus armed, though scales of this kind were developed by numerous extinct forms. (4) When the scales are very small, or represented by ossified papillæ of the cutis, they are called *placoid;* such are found in most of the sharks. Between these various types there are gradations, and there are also numerous modifications in other directions. The presence or absence of scales becomes also of slight systematic importance in some groups, and the same family may contain species with a scaleless body and others with scales of the ctenoid and cycloid types. The scales of various fishes, as the sheepshead, mullet, and drum, are used in the manufacture of ornamental work, as mock jewelry, flower-sprays, etc. Pearl-white or essence d'Orient, used in making artificial pearls, is prepared from the scales of *Alburnus lucidus* and other cyprinoid fishes. (*b*) In *herpet.*, one of the cuticular structures which form the usual covering of reptiles proper, as distinguished from amphibians, as a snake or lizard. These scales are commonly small, and are distinguished from the special *shields* or *plates* which cover the head, and the large specialized *gastrosteges* or *urosteges* of the under parts, as of a serpent. They are usually arranged in definite rows or series, and are also called *scutes* or *scutella.* In the *Chelonia* or turtles one of the thin plates of tortoise-shell which cover the carapace is a scale. See *tortoise-shell.* (*c*) In *ornith.*: (1) A reduced feather, lacking locked barbs, and with flattened stem: as, the *scales* of a penguin. (2) A feather with metallic luster or iridescence, as those on the throat of a humming-bird. (3) A nasal opercle; a naricorn: as, the nasal *scale.* (4) One of the large regular divisions of the tarsal envelop; a scutellum: the smaller or irregular pieces being usually called *plates.* (*d*) In *mammal.*, one of the cuticular plates which may replace hairs on much of the body: as, the *scales* of a pangolin.

Specifically—(*a*) A thin plate of bone; a scale-like or shell-like bone: as, the human lacrymal bone is a mere *scale;* the squamosal is a thin *scale* of bone. (*b*) A part of the periostracum, or epidermal covering of the shell of a mollusk. (*c*) One of the broad flat structures, or hemielytra, which cover some annelids, as the scalebacks, with a kind of defensive armor. (*d*) In *entom.*: (1) One of the minute structures which constitute the covering of the wings of lepidopterous insects, as the furriness of a butterfly or moth. These are modified hairs which when well developed are thin, flat plates, pointed at the end where they are attached to the surface and generally divided into a number of long teeth at the other end; they are set in rows overlapping each other slightly, like tiles or shingles on a roof. These scales are ornamented with microscopic lines, and are of various and often very bright colors. By covering the transparent membrane of the wings they form the beautiful patterns much admired in these insects. See cut in next column, and cut under *Lepidoptera.* (2) One of the plates, somewhat similar to those on a butterfly's wing, covering the bodies of most *Thysanura* (*Lepismatidæ, Poduridæ*). (3) One of the little flakes which, scattered singly or close together, so as to cover the whole surface in a uniform manner, ornament the bodies and

2. A series of marks laid down at determinate distances along a line, for purposes of measurement and computation; also, the rule upon which one or more such series are laid down.—**3.** In *music:* (*a*) A definite and standard series of tones within some large limiting interval, like an octave, selected for artistic purposes. The first step toward an artistic system of tones is the adoption of some interval for the division of the infinite possible range of tones into convenient sections of equal length. In Greek music, this unit of division was originally the tetrachord; in medieval music, the hexachord; and in modern music, the octave, though the octave is more or less recognized in all systems. Within the tetrachord, hexachord, or octave various scales are possible. (See *tetrachord* and *hexachord.*) The abstract method whereby the octave is divided and the succession of tones ordered within it is properly called a *mode;* but when a mode is applied at some given pitch the concrete result is called a *key* or *scale* (though *mode* and *scale* are often used interchangeably in the abstract sense). A scale is distinguished from a key in that it is used simply of the tones of the key when arranged in order of pitch. The successive tones of a scale are called *degrees;* they are usually numbered from below upward. The first tone or starting-tone is called the *key-note* or *key-tone.* The historic process of scale-invention is, of course, unconscious. The selection of tones seems to be controlled primarily by an instinctive perception of their harmonic relations to the starting-tone and to each other, though limited and modified by a desire to secure an even melodic succession without too short intervals. When the smallest interval allowed is the whole step or major second, five-toned or pentatonic scales are produced, such as are used among the Chinese, in the older music of various Celtic nations, and by certain semi-civilized peoples. When the half-step or semitone is tolerated, seven-toned or heptatonic scales are produced, as in the later Greek and all modern systems. When smaller intervals than the semitone are admitted, scales of more than seven tones are produced, as among the Hindus, the Persians, and other Orientals. In modern European music two chief forms of scale are used, the *major* and the *minor*, the latter having three varieties. (See *mode*[1], 7 (*a*) (3).) Both forms are termed *diatonic.* When, for purposes of modulation or of melodic variety, other intermediate tones are added, they are called *chromatic tones*, and a scale in which all the longer steps of a diatonic scale are divided by such intermediate tones is a *chromatic scale*, containing eleven tones in all. (See *chromatic.*) Properly an upward chromatic scale for melodic purposes differs from a downward, but on the keyboard they are assumed to be equivalent. In written music, a scale noted in both sharps and flats, so as to include the nominal constituents of both an upward and a downward chromatic scale, is called an *enharmonic scale.* A chromatic scale for harmonic purposes includes, in addition to the tones of the usual diatonic major scale, a minor second, a minor third, an augmented fourth, a minor sixth, and a minor seventh. When a scale of either kind is made up of tones having exact harmonic relations with the key-note, it is called *exact* or *pure;* but the compromise construction of the keyboard reduces all scales to an arbitrary form, called *tempered.* In solmization, the tones of a scale are represented by the syllables *do, re, mi*, etc. (See *interval, keyboard, solmization*, and *temperament.*) (*b*) Any particular scale based upon a given key-note: as, the *scale* of G or of F. Unless otherwise qualified, such a scale is understood to be a major scale. All major scales are essentially similar, except in pitch; all minor scales also. On the keyboard, however, there is considerable mechanical difference on account of the varying succession of the white and black digitals. (See *key*[1], 7.) (*c*) Of a voice or an instrument, same as *compass*, 5. (*d*) In an organ-pipe, the ratio between its width and its length: a broad scale producing full, sonorous tones, as in the open diapason; and a narrow scale, thin, string-like tones, as in the dulciana. The same usage occurs occasionally in connection with other instruments, referring to size in relation to the quality of the tones produced.

4. Succession of ascending or descending steps or degrees; progressive series; scheme of comparative rank or order; gradation.

There is in this universe a stair, or manifest *scale*, of creatures, rising not disorderly, or in confusion, but with a comely method and proportion.

5. A system of proportion by which definite magnitudes represent definite magnitudes, in a sculpture, picture, map, and the like; also, a system of proportion for taxation or other purpose.

Scales of four, six, seven, ten, and twelve terms have been used by different meteorological services. This is a scale of twelve terms, as follows: 1, light air; 2, light breeze; 3, gentle breeze; 4, moderate breeze; 5, fresh breeze; 6, strong breeze; 7, moderate gale; 8, fresh gale; 9, strong gale; 10, whole gale; 11, storm; 12, hurricane.

scapula (skap′ū-lä), *n.*; pl. *scapulæ* (-lē). [NL., < LL. *scapula*, the shoulder, in L. only in pl., *scapulæ*, the shoulder-blades, the shoulders, shoulder-pieces; prob. akin to L. *scapus*, a shaft, stem, stalk: see *scape*[2].] **1.** In *anat.*, the shoulder-blade, or blade-bone, or omoplate. It is the proximal element of the pectoral or scapular arch of vertebrates, especially of higher vertebrates, in which it is primitively the proximal part of a cartilaginous rod, the distal part of which is segmented off to form the coracoid. It assumes the most various shapes in different animals, but is usually flattened and expansive in mammals, in birds slender and saber-like. The scapula, whatever its shape, normally maintains connection with the coracoid, which is then a separate bone, but in all mammals above the monotremes the coracoid is completely consolidated with the scapula, appearing as a mere process of the latter. The human, like other mammalian scapulæ, with the exception noted, is therefore a compound bone, consisting of scapula and coracoid united. The scapula, or scapula and coracoid together, normally furnish an articulation for the clavicle when the latter is fully developed. In mammals above monotremes this articulation is with the spine or acromion. The glenoid cavity for the articulation of the humerus is always at the junction of the scapula proper with the coracoid, and when the latter is separate both bones enter into its formation. Morphologically a well-developed scapula, as in a mammal, has two ends, three borders, and three surfaces, corresponding to the prismatic rod of primitive cartilage, these parts, however, do not correspond with the borders, angles, and surfaces described in human anatomy (for which see *shoulder-blade*), the vertebral border, for instance, being really one end of the bone, and the edge of the spine being one of the morphological borders. The three surfaces correspond to the supraspinous, infraspinous, and subscapular fossæ, better known as the prescapular, postscapular, and subscapular surfaces. In all mammals and birds, and most reptiles proper, the scapula closely conforms to the characters here given. In batrachians and fishes, however, whose scapular arch is complicated with additional bones, the modifications are various, and some of the coracoid elements have been wrongly regarded and named as scapular. See cuts under *omosternum*, *scapulocoracoid*, and *shoulder-blade*. See also *postscapular*, *prescapular*, *subscapular*, *supracapular.*

In all higher vertebrates (mammals, birds, and reptiles) the scapular arch consists primitively of a cartilaginous rod, more or less perfectly segmented into a proximal moiety (scapula) and a distal moiety (coracoid), to which an accessory bone (clavicle) is frequently added, together with various other supplementary osseous or cartilaginous pieces, either in the median line in front or in the line of the clavicle. In a batrachian, as the frog, there is a distinct superior ossification forming a suprascapula, with a precoracoid and an epicoracoid, besides the coracoid proper. In fishes the scapular arch is still further modified, especially by the presence of additional coracoid elements which have been variously homologized. Scarabæidæ (skar-a-bē′i-dē), *n. pl.* [NL. (Leach, 1817), < *Scarabæus* + *-idæ*.] A very large family of beetles of the lamellicorn series, having the lamellæ of the antennal club capable of close apposition and not flattened, and having fossorial legs. The family contains about 7,000 described species, of which between 500 and 600 inhabit America north of Mexico. They are usually of large size, and among them are the largest beetles known. Many of them are leaf-feeders, others live on fruit, flowers, honey, sap, decaying animal matter, and excrement. The larvæ are robust white grubs, living ordinarily underground, or in decaying stumps and logs, or in dung. The males are usually much larger than the females, and are often distinguished by horns upon the head or prothorax, or by better-developed antennæ, or by modifications of the legs. Many noted pests to agriculture belong to this group, such as the May-beetles or June-bugs and cockchafers of America and Europe, the *Anisoplia austriaca* of the Russian wheat-fields, and the rose-chafer and fig-eater of the United States. Corresponding groups in former use are *Scarabæida*, *Scarabæides*, *Scarabæina*, and *Scarabæites*. See cuts under *Hercules-beetle*, *Pelidnota*, and *Scarabæus*.

scarabæidoid (skar-a-bē′i-doid), *a.* [< *scarabæid* + *-oid*.] Noting a stage of the larva (after the second molt) of those insects which undergo hypermetamorphosis, as the blister-beetles (*Meloidæ*). Scarabæus (skar-a-bē′us), *n.* [Also *Scarabeus*; NL. (Linnæus, 1767), < L. *scarabæus*, a beetle: see *scarab*.] **1.** An Old World genus of lamellicorn beetles, typical of the *Scarabæidæ*, formerly equivalent to *Lamellicornia*, now restricted to about 70 species distributed through Africa and the warmer parts of Europe and Asia. They are coprophagous in habit, the adults rolling up balls of excrement in which the females lay their eggs. The sacred scarab of the Egyptians is *S. sacer*, found throughout the countries bordering on the Mediterranean. It is probable also that another species, *S. laticollis*, was held in religious veneration by the Egyptians, as the scarab is sometimes figured by them with striate elytra, a character which pertains to this alone. Species of *Ateuchus*, as *A. pius*, were formerly included in this genus.

The physical use in MD. *schaers afscheren,* shear off close, shave close, It. *cogliere scarso,* strike close, graze (see *scarce, adv.*), *scarsare,* cut off, pinch, scant (see *scarce, v.*), suggests some confusion with MD. *schaers,* a pair of shears, also a plowshare, and the orig. verb *scheeren,* shear (see *shear*[1], *shears, share*[1]). The personal sense, 'sparing,' 'niggard,' is appar. the earliest in E. and OF.] **1†.** Sparing; parsimonious; niggard; niggardly; stingy.

schema (skē'mą), *n.*; pl. *schemata* (-mą-tą). [< L. *schema*, < Gr. *σχῆμα*, shape, figure, form: see *scheme*.] 1. A diagram, or graphical representation, of certain relations of a system of things, without any pretense to the correct representation of them in other respects; in the *Kantian philos.*, a product of the imagination intermediate between an image and a concept, being intuitive, and so capable of being observed, like the former, and general or quasi-general, like the latter.

The *schema* by itself is no doubt a product of the imagination only, but as the synthesis of the imagination does not aim at a single intuition, but at some kind of unity alone in the determination of the sensibility, the *schema* ought to be distinguished from the image. Thus, if I place five points, one after the other, ... , this is an image of the number five. If, on the contrary, I think of a number in general, whether it be five or a hundred, this thinking is rather the representation of a method of representing in one image a certain quantity (for instance, a thousand) according to a certain concept, than the image itself, which, in the case of a thousand, I could hardly take in and compare with the concept. This representation of a general procedure of the imagination by which a concept receives the image I call the *schema* of such a concept.
Kant, Critique of Pure Reason, tr. by Max Müller, p. 140.

2. Scheme; plan; outline; formerly, a geometrical diagram.—3. In *logic*, a figure of syllogism.—4. In *anc. gram.* and *rhet.*, a figure; a peculiar construction or mode of expression.—5. If our system of notation be complete, we must possess not only one notation capable of representing . . . syllogisms of every figure and of no figure, but another which shall at once and in the same diagram exhibit every syllogistic mode, apart from all *schematic* differences, be they positive, be they negative.

3. A system of schemata; a method of employing schemata.

We have seen that the only way in which objects can be given to us consists in a modification of our sensibility, and that pure concepts a priori must contain, besides the function of the understanding in the category itself, formal conditions a priori of sensibility (particularly of the internal sense) which form the general condition under which alone the category may be applied to any object. We call this formal and pure condition of the sensibility, to which the concept of the understanding is restricted in its application, its schema; and the function of the understanding in these schemata, the *schematism* of the pure understanding.

E. also *scism*; < ME. *scisme*, later *schisme*, < OF. *scisme*, *cisme*, F. *schisme* = Pr. *scisma*, *sisma* = Sp. *cisma* = Pg. *schisma* = It. *scisma*, < L. *schisma*, < Gr. *σχίσμα*, a cleft, split, schism, < *σχίζειν*, cleave, split, = L. *scindere* (√ *scid*), cut, = Skt. √ *chhid*, cut. Schism is a rent or division in the church when it comes to the separating of congregations. *Milton*, True Religion.

Attraction is the most general law in the material world, and prevents a *schism* in the universe.
Theodore Parker, Ten Sermons on Religion.

2. The offense of seeking to produce a division in a church. In the authorized version of the New Testament the word *schism* occurs but once (1 Cor. xii. 25); but in the Greek Testament the Greek word *σχίσμα* occurs eight times, being rendered in the English version 'rent' (Mat. ix. 16) and 'division' (John vii. 43; 1 Cor. xi. 18). From the simple meaning of division in the church the word has come to indicate a separation from the church, and now in ecclesiastical usage is employed solely to indicate a formal withdrawal from the church and the formation of or the uniting with a new organization. See def. 1.

From all false doctrine, heresy, and *schism*, . . . Good Lord, deliver us. *Book of Common Prayer*, Litany.

3. A schismatic body.

They doo therfore with a more constante mynde perseuer in theyr fyrst fayth which they receaued . . . than doo manye of vs, beinge diuided into *scismes* and sectes, whiche thynge neuer chaunceth amonge them.
R. Eden, tr. of John Faber (First Books on America, ed. [Arber, p. 290).

That Church that from the name of a distinct place takes autority to set up a distinct Faith or Government is a *Scism* and Faction, not a Church.
Milton, Eikonoklastes, xxvii.

Great schism. See *great*.—**Schism Act**, or **Schism Bill**, in *Eng. hist.*, an act of Parliament of 1713 (12 Anne, stat. 2, c. 7), "to prevent the growth of schism and for the further security of the churches of England and Ireland as by law established." It required teachers to conform to the established church, and refrain from attending dissenting places of worship. The act was repealed by 5 Geo. I., c. 4.

[< L. *schisma*, < Gr. *σχίσμα*, separation: see *schism*.] In *musical acoustics*, the interval between the octave of a given tone and the third of the eighth fifth, less four octaves, represented by the ratio $2:3^8 \div 2^{12} \times \frac{4}{5}$, or 32805 : 32768. This corresponds almost exactly to the difference between a pure and an equally tempered fifth, which difference is hence often called a *schisma*. A schisma and a diaschisma together make a syntonic comma.

schismatic (siz-mat'ik), *a.* and *n.* [Formerly also *scismatic*; < OF. In the great schism of the Western Church, in which the Churches of the West were for forty years nearly equally divided, each party was by the other regarded as *schismatic*, yet we cannot doubt that each belonged to the true Church of Christ. *Pusey*, Eirenicon, p. 67.

II. *n.* One who separates from an existing church or religious faith on account of a difference in opinion; one who partakes in a schism. See *schism*.

Dr. Pierce preach'd at White-hall on 2 Thessal. ch. 3. v. 6. against our late *schismatics*. *Evelyn*, Diary, Feb. 22, 1678.

Unity was Dante's leading doctrine, and therefore he puts Mahomet among the *schismatics*, not because he divided the Church, but the faith.

See cuts under *angler*, *Balistes*, and *Chimæridæ*.

schist (shist), *n.* [< F. *schiste*, < L. *schistos*, split, cleft, divided, < Gr. *σχιστός*, easily cleft, < *σχίζειν*, cleave: see *schism*.] A rock the constituent minerals of which have assumed a position in more or less closely parallel layers or folia, due not to deposition as a sediment, but — in large part, at least — to metamorphic action, which has caused a rearrangement or partial recrystallization of the component minerals, or the formation of new ones, these, in the course of the process, having assumed the parallel arrangement characteristic of the rock. *Schist* and *slate* are not essentially different terms; but of late years the latter has been chiefly employed to designate a fine-grained argillaceous rock divided into thin layers by cleavage-planes, and familiar in its use for roofing; while the word *schist* is generally employed in composition with a word indicating the peculiar mineral species of which the rock is chiefly made up, and which by its more or less complete foliation gives rise to the schistose structure: thus, *hornblende-schist*, *chlorite-schist*, *mica-schist*, etc. — all included under the general designation of *crystalline schists*, among which argillaceous schist also belongs, and from which it is separated only because its fissility is, as a general rule, more perfect than that of the other schists, and because it is for this reason of much practical importance, especially in its application to roofing. Also spelled *shist*.—**Knotted schist.** Same as *knot*[1], 3 (*f*).—**Protozoic schists.** See *protozoic*.

schistose, schistous (shis'tōs, -tus), *a.* [< *schist* + *-ose*, *-ous*.] Having the structure of schist; resembling schist, or made up of a rock so designated. A schistose structure differs from that resulting from sedimentation in that the former bears the marks of chemical action in the more or less complete interlacing or felting of the component particles, and in the continual breaks or want of continuity of the laminæ, while in the latter the particles are only held together by some cement differing from them in composition, or even by pressure alone, and are arranged in a more distinctly parallel order than is usually the case with the schists. In rocks in which a slaty cleavage is very highly developed, as in roofing-slate, this cleavage is almost always quite distinct from and independent in position of the lines of stratification, and this fact can ordinarily be recognized with ease in the field. There are cases, however, in which a schistose structure has been developed in a mass of rock parallel with the planes of stratification. Also spelled *shistose*, *shistous*.

schizomycete (skiz′ō-mī-sēt), *n.* A member of the *Schizomycetes*.

Schizomycetes (skiz″ō-mī-sē′tēz), *n. pl.* [NL., < Gr. *σχίζειν*, cleave, split, + *μύκης*, pl. *μύκητες*, a fungus, mushroom: see *Mycetes*[2].] A class or group of minute vegetable organisms known as bacteria, microbes, microphytes, etc., and allied forms, belonging to the achlorophyllous division of the *Schizosporeæ* of Cohn (the *Schizophyta* of later authorities), or to the branch *Protophyta* of other authors. They were at first regarded as being simple fungi, and hence are sometimes still called *fission fungi*, but recent investigations indicate that they are more closely allied to the *Schizophyceæ* or lower algæ than to the true fungi. They are probably degenerate algæ, a condition which has been brought about by their saprophytic or parasitic habits. They consist of single cells which may be spherical, oblong, or cylindrical in shape, or of filamentous or various other aggregations of such cells. The cells are commonly about 0.001 millimeter in diameter or from two to five times that measurement; but smaller and a few larger ones are known. They are, with one or two exceptions, destitute of chlorophyl, and multiply by repeated bipartitions. True spores are known in several forms, but no traces of sexual organs exist. They are saprophytic or parasitic, and occur the world over as saprophytes. They abound in running streams and rivers, in still ponds and ditches; in the sea, in bogs, drains, and refuse-heaps; in the soil, and wherever organic infusions are allowed to stand; in liquids containing organic matter, as blood, milk, wine, etc.; and on solid food-stuff, such as meat, vegetables, preserves, etc. As parasites, numerous species inhabit various organs of men and animals, causing most of the infectious diseases, as tuberculosis, typhoid fever, cholera, etc. Plants are subject to their attack to a more limited degree, a circumstance that may be due to the acid fluids of the higher vegetable organisms. Schizomycetes vary to a considerable extent according to the conditions of their environment, and hence many growth-forms occur which have frequently received different generic names. The round growth-forms are called *Coccus* or *Micrococcus;* the rod-like forms have been termed *Bacillus*, *Bacterium*, etc.; the shortly coiled forms are known as *Vibrio;* the spiral forms have received the names *Spirillum* or *Spirochæta;* and the very elongated filiform ones are *Leptothrix*, etc. Their behavior with reference to the supply or exclusion of oxygen has led to their division by Pasteur into *aërobiotic*, or such as require a plentiful supply of free oxygen for the purpose of vegetation, and *anaërobiotic*, or those in which vegetation is promoted by the exclusion of oxygen, or at least is possible when oxygen is excluded. There are, however, various intermediate forms. See *entophyte*, *Fungi*, *Protophyta*, *Bacteriaceæ*, *Bacterium*, *Micrococcus*, *Leptothrix*, *Bacillus*, *Spirillum*, *Spirochæta*, *Vibrio*.

Schizorhinæ (skiz-ō-rī′nē), *n. pl.* [NL.: see *schizorhinal.*] Schizorhinal birds collectively. *A. H. Garrod.*

schizorhinal (skiz-ō-rī′nal), *a.* [< Gr. *σχίζειν*, cleave, split, + *ῥίς* (*ῥιν-*), the nose, + *-al.*] In *ornith.*, having each nasal bone deeply cleft or forked: opposed to *holorhinal.* The term denotes the condition of the nasal bone on each side (right and left), and not the separateness of the two nasal bones, which it has been misunderstood to mean. By a further mistake, it has been made to mean a slit-like character of the external nostrils, with which it has nothing to do.

In the Columbidæ, and in a great many wading and swimming birds, whose palates are cleft (schizognathous), the nasal bones are *schizorhinal:* that is, cleft to or beyond the ends of the premaxillaries, such fission leaving the external descending process very distinct from the other, almost like a separate bone. Pigeons, gulls, plovers, cranes, auks, and other birds are thus split-nosed. *Coues*, Key to N. A. Birds, p. 165.

There are about 12 species, natives of the Malay archipelago, China, and the Pacific islands. They are tall and arborescent grasses, resembling the bamboo in habit and leaf. Several species reach 25 to 40 feet or more in height, and several are cultivated for ornament or for culinary use, the young shoots being eaten in Java and elsewhere under the name of *rebong.*

The blade is about 3 feet long and without point, the end being cut square off; each edge is very sharp for a few inches from the end of the blade. It is used with a sweeping blow around the adversary's guard, so as to cut the head or face with the sharpened corner. The schläger has a heavy basket-hilt completely protecting the hand. A heavy gauntlet of leather covers the arm to the elbow. The usual guard is by holding the blade nearly vertical, pommel uppermost, the hand just above the level of the eyes.

is bright blue, the fore back is rich yellow, the rest lustrous crimson; the breastplate is mostly glittering green, and other parts of the plumage are of varied and scarcely less burnished hues. The female is somewhat smaller, and in plumage unlike the male, as usual in this family. The species has several technical synonyms. Professor Schlegel called it *Paradisea calva*, but not till after Mr. Cassin of Philadelphia had dedicated it to Dr. T. B. Wilson of that city. Mr. Elliot, the monographer of the *Paradiseidæ*, has it *Diphyllodes respublica*, after a mistaken identification made by Dr. Sclater of a bird very inadequately characterized by Prince Bonaparte, which belongs to another genus.

Schleichera (shlī′kėr-ä), *n.* [NL. (Willdenow, 1805), named after J. C. *Schleicher*, a Swiss botanist, author (1800) of a Swiss flora.] A genus of dicotyledonous archichlamydeous plants of the family *Sapindaceæ*, type of the tribe *Schleichereæ.* It is characterized by apetalous flowers with a small calyx of valvate lobes and repand disk, six to eight long stamens, and an ovary with three or four cells, becoming a dry and indehiscent one- to three-celled ovoid and undivided fruit, containing a pulpy and edible aril about the black top-shaped seed. The only species, *S. trijuga*, is a native of tropical Asia and the Malay archipelago, especially abundant in Pegu, sometimes called *lac-tree*, and known in India as *koosumbia.* It is a large hard-wood tree with alternate and abruptly pinnate leaves, usually of three pairs of leaflets, and with small long-pedicelled flowers in slender racemes. Its timber is very strong, solid, and durable. In India and Ceylon it is valued as one of the trees frequented by the lac-insect (see *lac*[2]), and its young branches form an important source of shellac. The oil pressed from its seeds is there used for burning in lamps and as a remedy for the itch.

scholasticism (skō-las′ti-sizm), *n.* [= Sp. *escolasticismo* = G. *scholasticismus*, < NL. *scholasticismus*, scholasticism, < L. *scholasticus*, scholastic: see *scholastic*.] The Aristotelian teaching of the medieval schools and universities, and similar teaching in Roman Catholic institutions in modern times, characterized by acknowledgment of the authority of the church, by being largely, if not wholly, based upon the authority of the church fathers, of Aristotle, and of Arabian commentators, and by its stiff and formal method of discussion. It consisted of two distinct

and independent developments, the one previous the other subsequent to the discovery of the extra-logical works of Aristotle in the last part of the twelfth century. Scholasticism should be considered as arising about A. D. 1000, and is separated by a period of silence from the few writers between the cessation of the Roman schools and the lowest ebb of thought (such as Isidorus, Rhabanus, Gerbert, writers directly or indirectly under Arabian influence, Scotus Erigena and other Irish monks, the English Alcuin, with his pupil Fridigisus, etc.), writers marked by great ignorance, by a strong tendency to materialize abstractions, by a disposition to adopt opinions quite arbitrarily, but also by a certain freedom of thought. The first era of scholasticism was occupied by disputes concerning nominalism and realism. It naturally falls into two periods, since the disputants of the eleventh century took simple and extreme ground on one side or the other, the nominalistic rationalist Berengarius being opposed by the realistic prelate Lanfranc, the Platonizing nominalist Roscellin by the mystical realist Anselm; while in the twelfth century the opinions were sophisticated by distinctions until they cease to be readily classified as nominalistic and realistic. The scholastics of the latter period included Peter Abelard (1079–1142); Gilbert of Poitiers (died 1154), one of the few writers of the twelfth century ever quoted in the thirteenth; Peter Lombard (died 1164), compiler of the four books of "Sentences," or opinions of the fathers, which was the peg on which much later speculation was hung as commentary; and John of Salisbury (died 1180), an elegant and readable author. For more than a generation after his death the schoolmen were occupied with studying the works of Aristotle and the Arabians, without producing anything of their own. Then began the second era of scholasticism, and this divides itself into three periods. During the first, which extended to the last quarter of the thirteenth century, Alexander of Hales (died 1245), Albertus Magnus (1193–1280), and St. Thomas Aquinas (died 1274) set up the general framework of the scholastic philosophy, while Petrus Hispanus (perhaps identical with Pope John XXI., who died 1277) wrote the standard text-book of logic for the remainder of the middle ages, and Vincent of Beauvais (died about 1264) made an encyclopedia which is still found in every library of pretension. During this period the University of Paris received a thorough organization, and thought there became exclusively concentrated upon theology. The second period, which lasted for about a century, was the great age of scholastic thought, and it may be doubted whether the universities of western Europe have at any subsequent time been so worthy of respect as when Duns Scotus (died 1308) and his followers were working up the realistic conception of existence, while "Durus" Durandus (died 1332), Occam (died about 1349), and Buridanus (died after 1350) were urging their several nominalistic theories, and other writers, now so forgotten that it is useless to name them, were presenting other subtle propositions commanding serious examination. During this period the scholastic forms of discussion were fully elaborated—methods cumbrous and inelegant, but enforcing exactitude, and conformed to that stage of intellectual development. The third period, extending to the time of the extinction of scholasticism, earl. in the sixteenth century, presented somewhat different characters in different countries. It was, however, everywhere marked by the formal perfectionment of systems, and attention to trivial matters, with decided loss of vitality of thought. Among the innumerable writers of this time may be mentioned Albert of Saxony (fourteenth century), Pierre d'Ailly (1350–1425), Gerson (1363–1429), and Eckius, adversary of Luther. Those subsequent writers who follow colorless traditions of scholasticism, and maintain front against modern thought, must be considered as belonging to an era different from either of those mentioned.

Explanatory notes inserted by editors in the text of Euclid's "Elements" were called *scholia*, and the style of exposition resulting from this was considered by later writers so admirable that they deliberately left occasion for and inserted scholia in their own writings. A geometrical scholium is, therefore, now an explanation or reflection inserted into a work on geometry in such a way as to interrupt the current of mathematical thought.

They are epiphytes with handsome flowers in a simple raceme on an elongated terminal peduncle, and thick pseudobulbs or long fleshy stems, which are covered with many sheaths and bear at the apex one, two, or three ovate or elongated rigid and fleshy leaves. They are remarkable for the very long and slender flower-stems, and the large dry sheaths enveloping them. In *S. tibicinis* of Honduras, the hollow pseudobulb, from 1 to 2 feet long, is a favorite with ants for the construction of their nests, and is used by children as a trumpet (whence also its name in cultivation of *cow-horn orchid*).

The fundamental principle of this school is that the books of the New Testament were written for the purpose of establishing certain opinions and parties in the early church, that many of them were written at a later date than the one usually assigned to them, and that they are rather valuable as indications of the spirit of the early church than as authoritative revelations, or even as authentic records. The name is also sometimes, though more rarely, given to an earlier school in the same university, which taught almost exactly the reverse—namely, the credibility, integrity, and authority of the New Testament.

In this narrow sense the species are still so numerous in all warm seas that attempts have been made to establish various sections regarded by some as of generic

value. The fish to which the classic name *sciæna* was given is the maigre, *S. aquila*. *S.* (*Sciænops*) *ocellata* is the redfish, red-horse, red-bass, or channel-bass, which occurs along the Atlantic coast of the United States, attains a weight of from 30 to 40 pounds, and is known by an ocellus on each side of the tail (see cut under *redfish*). *S.* (*Rhinoscion*) *saturna* is the red roncador of the same country. See also cut under *roncador*.

Sciænidæ (sī-en'i-dē), *n. pl.* [NL., < *Sciæna* + *-idæ*.] A family of acanthopterygian fishes, typified by the genus *Sciæna*, to which different limits have been ascribed. (*a*) By Bonaparte, in 1833, the name was applied to the *Scienoïdes*, which form Cuvier's third family of acanthopterygian fishes. These have the preoperculum serrated and spines to the operculum, the bones of the cranium and face generally cavernous, and no teeth on the vomer and palatines. It included not only the true *Sciænidæ*, but many other fishes erroneously supposed to be related. (*b*) By Müller it was restricted to those species of *Scienoïdes* which have separate lower pharyngeals. (*c*) By Lowe it was limited to fishes with an oblong or moderately elongated body, covered with ctenoid scales, with the lateral line continuous and running out on the caudal fin, the head with the bones more or less cavernous and with the snout projecting, dorsal fins two (the first short and with spines and the second elongate or oblong), the anal short or moderate with not more than two spines, the pectorals with branched rays, and the ventrals thoracic and complete. In this sense it has been used by almost all recent writers. (*d*) In Günther's system it is the only family of the *Acanthopterygii sciæniformes*. It is a large and important family of 150 species of about 30 genera; many reach a large size, and nearly all are valued food-fishes. They are carnivorous, and most of them make a noise variously called *croaking, grunting, snoring*, and *drumming*. The air-bladder is generally complicated, and supposed to be concerned in the production of the noise. Hence various names of these fishes, as *croakers, grunters* or *grunts, drums, roncadors*, etc. With few exceptions, the members of this family are salt-water fishes, and they are widely distributed in tropical, warm, and temperate seas. Two species are British, the maigre, *Sciæna* (*Pseudosciæna*) *aquila*, and the bearded umbrina, *Umbrina cirrosa*. Many are American, as the fresh-water drum, croaker, sheepshead, or thunder-pumper, *Aplodinotus grunniens*; the drum, *Pogonias chromis*; redfish and roncadors of the genera *Sciæna, Sciænops*, and *Roncador*; the spot, *Liostomus Xanthurus*; a kind of croaker, *Micropogon undulatus*; roncadors of the genus *Umbrina*; kingfish of the genus *Menticirrus*; queenfish of the genus *Seriphus*; weakfish, sea-trout, or squeteagues of the genus *Cynoscion* (formerly *Otolithus*). The family is divisible into the subfamilies *Sciæninæ, Otolithinæ, Liostominæ*, and *Haplodinotinæ*. Also *Sciænoideæ*. See cuts under *croaker, drum, redfish, roncador, Sciæna*, and *weakfish*.

There are 10 species, natives of the East Indies, especially Bengal and Java. They are climbing shrubs clinging by rootlets produced on the branches, and bear taper-pointed leaves, ovate or narrower, with long broadly sheathing petioles. The flowers are borne in dense masses over a cylindrical spadix inclosed in a boat-shaped spathe, and form in fruit a syncarp of closely united juicy berries. 3. Specifically, the twinkling or tremulous motion of the light of the larger fixed stars. By shaking the head, so as to elongate the image, it is seen that not merely the intensity, but also the color of the light varies. See *scintillometer*.

scintillometer (sin-ti-lom'e-tėr), *n.* [< L. *scintilla*, a spark, + Gr. *μέτρον*, measure.] An instrument devised by Montigny for measuring the intensity of scintillation of the stars. The apparatus consists essentially of a circular glass plate mounted obliquely upon an axis very near and in front of the eyepiece of a telescope. An opening in the center of the plate allows the insertion of a ring, through which passes the axis, parallel to the optical axis of the telescope and at a distance from it of about twenty-five millimeters. The plate is rotated about the axis by a mechanism. By this device, the rays of light from a star are refracted through the inclined glass plate, and the image describes a perfect circle in the field. If the star undergoes no change, the circumference is a continuous line exhibiting the color of the star; but if the star scintillates, this circumference is divided into fugitive arcs of different colors. The number of changes of color per unit of time indicates the intensity of the scintillation.

It includes about 1,500 species, of 18 genera, of which *Scirpus*, the bulrush, is the type. They are grass-like or rush-like plants, with either triangular or rounded stems, and with long flat triangular or cylindrical leaves. It is characterized by small many-flowered roundish spikelets with imbricated and numerous glumes, each flower bisexual and usually with six bristles, representing a perianth, and surrounding the ovary, from which the continuous and slender style falls away without leaving any conspicuous tubercle. Over 300 species have been described, now reduced to 200 by the best authorities. About 30 species occur in the United States. They are small tufted or floating annuals, or strong perennials with a creeping rootstock, bearing usually a compound panicle of numerous brown spikelets, sometimes reduced to a small cluster or solitary. They are known by the general names *bulrush* and *club-rush*, the first applied especially to *S. lacustris*, a species of peculiar habit, with tall, smooth, round stems of a blue-green color projecting out of lake- and river-waters; also called in England *matrush*, from its use in making mats, ropes, chair-bottoms, and hassocks. The subspecies *occidentalis* and the kindred species *S. riparius* are the tule of California. (See *tule*.) *S. maritimus*, the sea club-rush, with a dense compact cluster of large spreading spikelets, each often over an inch long, is a characteristic feature of sea-shore marshes in both tropical and temperate climates throughout the world. (For *S. cæspitosus*, see *deer-hair*.) *S. cyperinus*, one of the most conspicuous of American rushes in fresh-water swamps, ranging from Newfoundland to Virginia and Kentucky, is known as *wool-grass* and *cotton-grass*.

Their color is black or brown, and they are almost exclusively lignivorous in habit. Nearly 1,000 species have been described, of which 150 belong to temperate North America. *Xyleborus dispar*, the shot-borer or pin-borer, and *Tomicus calligraphus*, the fine-writing bark-beetle, are familiar examples. They are physoclistous fishes, with the body scaly and a series of keeled scales along each side of the belly, the margin of the upper jaw formed by the intermaxillaries mesially and by the maxillaries laterally, the lower pharyngeals united in a single bone, and the dorsal fin opposite the anal. In a broad sense, the family consists of about 8 genera and 100 species, including the belonids or gars, the hemirhamphines or halfbeaks, and the exocœtines or flying-fish. In a restricted sense, it includes the flying-fishes and hemirhamphines as well as the sauries, the belonids being excluded. Also *Scombresocidæ*. See cut under *saury*.

The dorsal and anal fins are opposite as in *Esox*, and finlets are developed as in *Scomber*. In *S. saurus*, the true saury, also called *skipper* and *bill-fish*, the beak is long; the color is olive-brown, silvery on the sides and belly; and the length is about 18 inches. This species is wide-ranging in the open sea. *Cololabis brevirostris* is a smaller saury, with the jaws scarcely forming a beak; it is found on the coast of California. Also *Scombresox*. They are fishes of the high seas, graceful in form, beautiful in color, and among the best for the table. A technical difference from *Scomber* is the length of the spinous dorsal fin, which has more than twelve spines and is contiguous to the second dorsal, the presence of a caudal keel, the strength of the jaw-teeth, and the weakness of those on the vomerine and palatine bones. This genus used to be called *Cybium*; its type is the cero, *S. regalis*, which attains a weight of 20 pounds. *S. caballa* sometimes weighs 100 pounds. All the foregoing inhabit the Atlantic, *S. concolor* the Pacific.

genus *Scomber*, to which very different limits have been ascribed. (*a*) In Günther's system, a family of *Acanthopterygii cottoscombriformes*, with unarmed cheeks, two dorsal fins, either finlets or the spinous dorsal composed of free spines or modified into a suctorial disk, or the ventrals jugular and composed of four rays, and scales none or very small. (*b*) By Bonaparte, first used as a synonym of *Scomberoides* of Cuvier; later restricted to such forms as had two dorsal fins or several of the first rays of the dorsal spiniform. (*c*) By Gill, limited to *Scombroidea* of a fusiform shape, with the first dorsal fin elongate, or separated by a wide interval from the soft dorsal, with posterior rays of the second dorsal and of the anal generally detached as special finlets, and with numerous vertebræ. The body is elongate, not much compressed, and covered with minute cycloid scales, or quite naked; the scales sometimes united into a kind of corselet anteriorly; the lateral line is present; the branchiostegals are seven; the dorsal fins two, of which the first has rather weak spines, and the second resembles the anal; the caudal peduncle is very slender, usually keeled, and the lobes of the caudal fin are divergent and falcate, producing the characteristic deeply forked tail; the ventral fins are thoracic in position, of moderate size, with a spine and several soft rays; the vertebræ are numerous (more than twenty-five); pyloric cæca are many; the air-bladder is present or absent; the coloration is metallic and often brilliant. There are 17 genera and about 70 species, all of the high seas and wide-ranging, in some cases cosmopolitan; and among them are extremely valuable food-fishes, as mackerel of all kinds, bonitos, tunnies, and others. Scombrinæ (skom-brī'nē), *n. pl.* [NL., < *Scomber*[2] + *-inæ*.] A subfamily of *Scombridæ*, to which various limits have been assigned. (*a*) By Gill, limited to those *Scombridæ* which have two dorsals widely distant, and thus including only the typical mackerels and frigate-mackerels. (*b*) By Jordan and Gilbert, extended to embrace those with finlets, and with the dorsal spines less than twenty in number. It thus includes the mackerels, frigate-mackerels, tunnies, bonitos, and Spanish mackerel.

Scombroides (skom-broi'dēz), *n.* [NL. (Lacépède, 1802), < Gr. *σκόμβρος*, mackerel, + *εἶδος*, form.] A genus of carangoid fishes, typical of the subfamily *Scomberoidinæ*. They are numerous in tropical seas. By recent writers two subdivisions are ranked as genera. In the typical species the dorsal spines are seven in number, the pterygoids are armed with teeth, and the scales are normally developed. But in the American representative there are no pterygoid teeth, and the linear scales are embedded. Such is the character of the genus called *Oligoplites*, to which belongs the well-known leather-jacket, *O. saurus*, of both coasts of Central America and north to New York and California. It is bluish above, silvery below, with yellow fins.

=**Syn. 1.** *Scorch*, *Singe*, *Sear*, *Char*, *Parch*. To *scorch* is to burn superficially or slightly, but so as to change the color or injure the texture; sometimes, from the common effect of heat, the word suggests shriveling or curling, but not generally. *Singe* is one degree more external than *scorch;* we speak of *singeing* the hair and *scorching* the skin; a fowl is *singed* to remove the hairs after plucking out the feathers. *Sear* has primary reference to drying, but more commonly to hardening, by heat, as by cauterization; hence its figurative use, as when we speak of *seared* sensibilities, a *seared* conscience, heat not being thought of as

a part of the figure. To *char* is to reduce to carbon or a black cinder, especially on the surface: when a timber is *charred* it is burned black on the outside and to an uncertain depth. *Parch* has a possible meaning of burning superficially or roasting, as in *parched* corn or peanuts, but almost always refers to drying or shriveling.

9. In *music*, a written or printed draft or copy of a composition on a set of two or more staffs braced and barred together. In a *full* or *orchestral* score, a separate staff is assigned to each instrument and voice, so that it contains all that is indicated in all the instrumental or vocal parts taken together. A *vocal* or *piano* score is one in which the voice-parts are given in full, usually on separate staffs, while the accompaniment is condensed into two staffs for performance on a pianoforte or organ. An *organ* score is either the same as the last or one in which three staffs are used, as in regular organ music. A score in which more than one part is written on a staff is called *short*, *close*, or *compressed*, especially in the case of four-part vocal music when written on two staffs; but these terms are also occasionally applied to an abridged or skeleton transcription. In an orchestral score the various parts are usually grouped, so that instruments of the same class appear together. The usual arrangement is (read downward) wood wind (flutes, oboes, clarinets, bassoons), brass wind (horns, trumpets, trombones), percussives (tympani, cymbals), upper strings (violins, violas), voices (soprano, alto, tenor, bass), lower strings (violoncellos, double basses); but considerable variations from this order occur. The arts of reading from a full score, and of transcribing for the pianoforte from such a score, are among the most difficult branches of musical accomplishment. Also *partition*.

I use the phrase in *score*, as Dr. Johnson has explained it in his Dictionary: "A song in *score*, the words with the musical notes of a song annexed." But I understand that in scientific propriety it means all the parts of a musical composition noted down in the characters by which it is exhibited to the eye of the skilful.
Boswell, Life of Johnson, æt. 66, note.

=**Syn. 1.** *Contemn*, *Despise*, *Scorn*, *Disdain*. *Contemn*, *scorn*, and *disdain* less often apply to persons. In this they differ from the corresponding nouns and from *despise*, which apply with equal freedom to persons and things. *Contemn* is the generic term, expressing the fact; it is not so strong as *contempt*. To *despise* is to look down upon with strong contempt from a superior position of some sort. To *scorn* is to have an extreme and passionate contempt for. To *disdain* is to have a high-minded abhorrence of, or a proud and haughty contempt of. See *arrogance*.

tals of a pale leek-green or liver-brown color. It occurs in many localities, associated with arsenical ores, especially with arsenopyrite; it has also been observed as a deposit about some hot springs, as in the Yellowstone region.

Scorpæna (skôr-pē′nä), *n.* [NL. (Artedi; Linnæus, 1758), < L. *scorpæna*, < Gr. σκόρπαινα, a fish, *Scorpæna scrofa*, so called in allusion to the dorsal spines, which are capable of inflicting a stinging wound; < σκορπίος, a scorpion: see *scorpion*.] A Linnean genus of fishes, used with varying latitude, now closely restricted and made the type of the family *Scorpænidæ*. The original fish of this name is *S. scrofa*, of European waters. Another is *S. porcus*, known as *pig-foot*, found in southern Europe. *S. guttata* is a Californian representative known as *scorpion* or *scorpene*, also *sculpin*; and other species are called in Spanish-speaking countries *rascacios*. See *hogfish*.

Scorpene (*Scorpæna guttata*).

Scorpænidæ (skôr-pē′ni-dē), *n. pl.* [NL., < *Scorpæna* + *-idæ*.] A family of acanthopterygian fishes, typified by the genus *Scorpæna*, to which different limits have been assigned. (*a*) In Günther's system, a family of *Acanthopterygii perciformes* with perfect or nearly perfect ventrals, and a bony stay for the angle of the preoperculum, which is armed, this stay arising from the infraorbital ring. (*b*) In Gill's system, those *Scorpænoidea* which have the dorsal fin consisting of an elongated spinigerous and short arthropterous section; well-developed thoracic or post-thoracic ventrals; head moderately compressed; branchial apertures extending forward and not separated by an isthmus; and a dorsadiform (or nuchadiform) trunk. The scorpænoids resemble percoids, having the body oblong, more or less compressed, with usually large head and wide terminal mouth, and ridges or spines on the top and also on the opercles. A bony stay extends from the suborbital to the preopercle; the gill-slits are wide; the scales are ctenoid (sometimes cycloid); and the lateral line is single. The ventrals are thoracic, with one spine and typically five rays; the dorsal is rather long with numerous (from eight to sixteen) spines and about as many soft rays; the anal is rather short, with three spines and from five to ten rays. The pseudobranchiæ are large, the pyloric cæca few (less than twelve in number), and an air-bladder is present. Over 20 genera and 200 species inhabit all seas; they are specially numerous in temperate regions of the Pacific ocean, where they form a large, conspicuous, and economically important feature of the piscifauna. The northern species mostly live about rocks, and hence their most general name is *rockfish* or *rock-cod*. Many are viviparous, the young being born alive when about a fourth of an inch long; some of them attain a large size, and all are used for food. Besides *Scorpæna*, notable genera which include American forms are *Sebastes*, *Sebastodes*, and *Sebastichthys*, including a great variety of rockfish or rock-cod, mainly of the Pacific coast, known as *rose-fish*, *redfish*, *snapper*, *boccaccio*, *merou*, *priest-fish*, *viuva*, *garrupa*, *fiaum*, *rasher* or *rasciera*, *tambor*, *corsair*, *fly-fish*, *rena*, *Spanish-flag*, *tree-fish*, etc. See the generic and vernacular names, and cuts under *priest-fish*, *rockfish*, *Sebastes*, *Spanish-flag*, *corsair*, and *Scorpæna*.

Scorpæninæ (skôr-pē-nī′nē), *n. pl.* [NL., < *Scorpæna* + *-inæ*.] A subfamily of *Scorpænidæ*, exemplified by the genus *Scorpæna*, with three pairs of epipharyngeals, vertebræ in variable number, and the dorsal commencing above the operculum. The species are mostly tropical and most numerous in the Indo-Pacific region. Some of them are remarkable for brilliancy of color and the development of spines or fringes.

scorpene (skôr′pēn), *n.* [< It. *scorpina* = OF. *scorpene*, < L. *scorpæna*, a fish, *Scorpæna scrofa*: see *Scorpæna*. The name for *S. scrofa* was transferred by the Italian fishermen on the Californian coast to *S. guttata*.] A scorpænoid fish, *Scorpæna guttata*. The cheeks, opercle, and top of the head are naked, the breast is scaly, and the color is brown mottled and blotched with rosy purplish and pale olive. It is about a foot long, and is abundant on the southern Californian coast, where it is also called *sculpin*. See cut under *Scorpæna*.

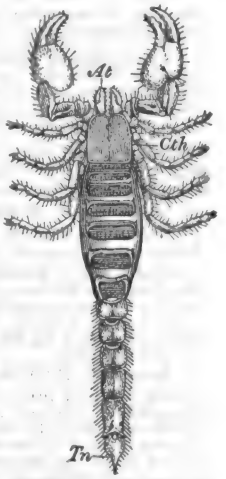
Scorpio (skôr′pi-ō), *n.* [L. NL.: see *scorpion*.] 1. In *zoöl.*, a Linnean genus of arachnidans, equivalent to the modern order *Scorpionida*, used with various restrictions, now the type of the limited family *Scorpionidæ*. See *scorpion*.—2. A constellation and the eighth sign of the zodiac, represented by the character ♏. The constellation, which is prominent in early summer in the skies of the southern United States (where the whole of the magnificent tail clears the horizon), contains the first-magnitude red star Antares and several of the second magnitude. With the Chaldeans and Greeks it extended over one sixth of the planetary circle, the scorpion being represented with exaggerated claws embracing a circular space where Libra is now placed. From this irregularity it may be inferred that the constellation is older than the zodiac, which was formed before 2000 B. C. Libra, though later, is of no small antiquity, since it appears in the Egyptian zodiacs. Its adoption by Julius Cæsar in his calendar made it familiar. Ptolemy, however, though living in Egypt nearly two centuries later, follows Babylonian and Greek astronomers in covering the place of Libra with the scorpion's claws. In designating the stars of this constellation by means of the Greek letters, the genitive *Scorpii* (from the alternative Latin form *scorpius*: see *scorpion*) is used: thus, Antares is *α Scorpii*.



The Constellation Scorpio (the Scorpion), with Libra.

Scorpiodea, Scorpioidea (skôr-pi-ō′dē-ä, -oi′dē-ä), *n. pl.* [NL.: see *scorpioid*.] Same as *Scorpionida*.

In *zoöl.*: (*a*) Resembling or related to a scorpion; belonging to the *Scorpionida*. (*b*) Rolled over or curled like the tail of a scorpion; cincinnal; coiled in a flat spiral.—2. In *bot.*, curved or circinate at the end, like the tail of a scorpion; rolled up toward one side in the manner of a crozier, unrolling as the flowers expand, as in some of the *Boraginaceæ*. See cut in next column.

scorpion (skôr′pi-on), *n.* [< ME. *scorpion*, *scorpioun*, *scorpiun*, < OF. *scorpion*, *scorpiun*, *escorpion*, F. *scorpion* = Pr. Sp. *escorpion* = Pg. *escorpião* = It. *scorpione*, also *scorpio* = D. *schorpioen* = MLG. *schorpiōn*, *schorpie* = OHG. *scorpjo*, *scorpo*, MHG. *schorpe*, *schorp*, *scorpe*, *scorp*, G. *scorpion* = Sw. Dan. *skorpion*, < L. *scorpio(n-)*, also *scorpius*, < Gr. σκορπίος (later also σκορπίων in sense of a military engine), a scorpion, also a prickly sea-fish, a prickly plant, the constellation so called, a military engine.] 1. In *zoöl.*, an arthropod of the order *Scorpionida*. It has an elongated body: the cephalothorax is continuous with the abdomen, which ends in a long slender post-abdomen, which latter can be curled up over the back and is armed at the end with a sharp sting or telson, more or less hooked like a claw, and connected with a venom-gland, so that its puncture inflicts a poisoned wound. (See also cuts under *Buthus* and *Scorpionidæ*.) The sting of a scorpion is painful, and is said to paralyze the organs of speech. The scorpion has also a large pair of nippers in front, like the great claws of a lobster, and the whole figure is suggestive of a little lobster, an inch or a few inches long. Scorpions abound in tropical and warm temperate countries. In the former they attain the maximum size of 8 or 10 inches, and are very formidable. They commonly lurk in dark retreats, as under stones and logs, and are particularly active at night. They are carnivorous and predaceous; they seize their prey with their nippers, and sting it to death. Scorpions are justly dreaded, but some popular beliefs respecting them have no foundation in fact, as that when the creature is surrounded by fire it stings itself to death rather than be burned, or that some fluid extracted from a scorpion will cure its sting.

Scorpion (*Scorpio afer*), seen from above.

At, the cheliceræ, or chelate antennæ; the large claws are chelate pedipalpi; *Cth*, cephalothorax; the first two legs are cephalic appendages, the next two thoracic; *Tn*, the telson or sting.

Hence—2. Some creature likened to or mistaken for a scorpion, and poisonous or supposed to be so. (*a*) A false scorpion; any member of the *Pseudoscorpiones*. Among these arachnidans, belonging to the same class as the true scorpion, but to a different order, the members of the genus *Chelifer* are known as *book-scorpions*. (See *Cheliferidæ*, and cut under *Pseudoscorpiones*.) Those called *whip-scorpions* are of the family *Thelyphonidæ*. (See cut under *Pedipalpi*.) Closely related to these, and sometimes sharing the name, are the *Phrynidæ*. (See cut under *Phrynidæ*.) (*b*) Centipeds and tarantulas are often confounded in the popular mind with scorpions, as are also (*c*) various small lizards, in the latter case probably from the habit some of them have of carrying their tails up. Thus, in the United States, some harmless lizards or skinks, as of the genera *Sceloporus* and *Eumeces*, are commonly called *scorpions*. (*d*) Same as *scorpion-bug*.

3. In *ichth.*, a scorpion-fish or sea-scorpion; one of several different members of the *Scorpænidæ*, some of which are also called *scorpene* and *sculpin*. See cut under *Scorpæna*, and etymology of *Scolopendra*.—4. [*cap.*] In *astron.*, the eighth sign of the zodiac, which the sun enters about October 23d. See *Scorpio*, 2.

If the people resisted [Rehoboam], they should be punished not with whips, but with *scorpions:* that is, rods of knotted wood furnished with barbs, producing a wound like the bite of a scorpion.

Von Ranke, Univ. Hist. (trans.), p. 57.

6. An old military engine, used chiefly in the defense of the walls of a town. It resembled the ballista in form, consisting essentially of two beams with ropes stretched between them, from the middle of which ropes rose a third beam, called the *stylus*, so disposed as to be pulled back and let go at pleasure; to the top of this beam were fastened iron hooks to which a sling of iron or hemp for throwing stones was hung.

Their scathfull *Scorpions*, that ruynes the wall.

See cut under *Panorpa*.

The ambulatory legs are seven-jointed, and of moderate and approximately equal lengths. The eyes are from six to twelve in number. The falces or cheliceræ are well developed and pincer-like. There are four pairs of pulmotracheæ. The long postabdomen or tail is very flexible, and is generally carried curled up over the back; the hook with which it ends is perforated for a poison-duct, and constitutes a sting, sometimes of very formidable character. The order is very homogeneous, and all the forms of it were formerly included in a single family, *Scorpionidæ*, or even in the genus *Scorpio*. It has been divided, according to the number of eyes (six, eight, ten, or twelve), into *Scorpionidæ*, *Telegonidæ*, *Vejovidæ*, and *Androctonidæ*, and in other ways. From 1 to more than 30 genera are recognized. See cut for *Scorpionidæ* above, and those under *Buthus* and *scorpion*.

'scorpion-tailed,' < σκορπίος, scorpion, + οὐρά, tail.] A genus of leguminous plants, of the family *Fabaceæ*, tribe *Hedysareæ*, and subtribe *Coronilleæ*. It is characterized by flowers solitary or few on a leafless peduncle with beaked keel-petals, and a cylindrical, furrowed, and circinately coiled pod, which is commonly warty or prickly and does not split open, but breaks across into joints containing roundish seeds with remarkably twisted and elongated seed-leaves. There are about 6 species, natives especially of the Mediterranean region, extending from the Canary Islands into western Asia. They are stemless or decumbent herbs, with entire and simple leaves, unlike most of the family in this last respect, and with small yellow nodding flowers. They are curious but not ornamental plants; their rough coiled pods, called "caterpillars," are sometimes used to garnish dishes. The species have been named *scorpion's-tail* and *caterpillar-plant*.

A genus of plants, belonging to the family *Cichoriaceæ*, type of the tribe *Scorzuntereæ*. It is characterized by flowers with involucral bracts of many gradually increasing series, plumose and unequal pappus of many rows, and many-ribbed achenes without a beak and commonly without wings. There are about 100 species, natives especially of the Mediterranean region, extending into central Asia. They are smooth, woolly, or bristly plants, generally perennials, bearing alternate and grass-like or broader and dissected leaves, and rather large long-stalked heads of yellow flowers. The best-known species is *S. Hispanica*, the black salsify, much cultivated, chiefly in Europe, for its root, which is used as a vegetable, and has, when moderately boiled, the remedial properties of dandelion. *S. deliciosa* of Sicily is said to be equal to salsify, and *S. crocifolia* in Greece is a favorite salad and spinach. *S. tuberosa* and perhaps other eastern species afford an edible root. An old name of *S. Hispanica* is *viper's-grass*.

As with most other names of the early Celtic and Teutonic tribes, the origin of the name is unknown; it has been variously referred—(*a*) to Gael. *sguit* = Ir. *scuite*, a wanderer; (*b*) to Gr. Σκύθης, L. *Scytha*, *Scythes*, a Scythian, said to mean 'wanderer,' 'nomad,' or, according to an old view, 'an archer' (see *Scythian*); (*c*) to Gr. σκότος, darkness (the LL. *Scotus*, prop. *Scōtus*, being taken in this view as *Scŏtus*, with a short vowel) (see *scotia*). Part of the immunity which the outlaws enjoyed was no doubt owing to the connivance of the officers of the forest, who levied forced contributions from them, and compelled all who feared their displeasure to drink at ale-houses which they kept, this extortionate practice being known as *Scothala* or Scotteshale. These exactions were curbed by the Statute of Fines Levied (27 Ed. I., A. D. 1299), which enacted that, "No Forester or Bedel from henceforth shall make *Scotal*, or gather garb, or oats, or any corn, lamb, or pig, nor shall make any (gathering but) by the sight and upon the (view) of the twelve Rangers, when they shall make their (range)."

Scotism (skō'tizm), *n.* [< *Scotus* (see def.) + *-ism*.] The metaphysical system of John Duns Scotus (born probably at Duns in Berwickshire, Scotland, though the place is doubtful; died at Cologne in 1308), the most acute thinker of the middle ages. His method is the logical analysis of the elements of existence. His fundamental doctrine is that distinctions which the mind inevitably draws are to be considered as real, although they do not exist in the things apart from their relations to mind. Such distinctions were called *formal*, the abstractions thence resulting *formalities*, and those who insisted upon them *formalists* or *formalizers* (Middle Latin *formalizantes*). He taught the important principle of hæccеity—that individual existence is no quality, is capable of no description or general conception, but is a peculiar element of being. He held that the natures of genera and species, as *animal* and *horse*, are real, and are not in themselves either general or particular, though they cannot exist except as particular nor be thought except as general. The teaching of Scotism in the English universities was prohibited by the royal injunctions of 1535.

mechanical powers, and is virtually a spiral inclined plane—only, the inclined plane is commonly used to overcome gravity, while the screw is more often used to overcome some other resistance. Screws are *right* or *left* according to the direction of the spiral. They are used (1) for balancing forces, as the jack-screw against gravity, the propeller-screw against the resistance of water, ordinary screws against friction in fastening pieces together, the screw-press against elasticity, etc.; and (2) for magnifying a motion and rendering it easily manageable and measurable, as in the screw-feet of instruments, micrometer-screws, etc. For the *pitch* of a screw, see *pitch*[1], 7 (*b*). If the hollow screw is turned while the inner one is prevented from turning, the latter advances proportionally to the difference of the pitches.—**Double screw**, a screw which has two consecutive spiral ridges or threads, both having the same pitch.—**Endless screw.** See *endless*.—**Female screw.** See *female*.—**Flat screw**, a spiral groove cut in the face of a disk, which by its revolution communicates a rectilinear motion to a sliding bar carrying a pin which works in the groove.—**Fossil screw.** See *fossil* and *screwstone*.—**Hindley's screw**, a screw cut on a solid, of such form that if any plane be taken through its longitudinal axis, the intersections of the plane by the perimeter are arcs of the pitch-circle of a wheel into which the screw is intended to work. It is so named from having been first employed by Mr. Hindley of York in England.—**Hunter's screw** [named from its inventor, Dr. John *Hunter*], a double screw consisting of a principal male screw that turns in a nut, but in the cylinder of which, concentric with its axis, is formed a female screw of different pitch that turns on a secondary but fixed male screw. The device furnishes a screw of slow but enormous lifting power without the necessity of finely cut and consequently frail threads. Everything else being equal, the lifting power of this screw increases exactly as the difference between the pitches of the principal male screw and the female screw diminishes, in accordance with the principle of virtual velocities.—**Interior screw.** See *interior*.—**Interrupted screw**, in *mach.*, a screw part or parts of whose thread are cut away, rendering it discontinuous; specifically, a screw whose exterior is divided into six

equal parts, with the screw-threads removed from alternate sectors, used to form the closure of a breech-loading cannon. In some cases the interruptions extend entirely around the screw, so that, in the common parlance of mechanics, "every other thread" is removed. Such a screw will turn perfectly in a nut of sufficient length. See cut under *cannon*.—**Involution of six screws.** See *involution*.—**Left-handed screw,** a screw which is advanced by turning from right to left, in contradistinction to the usual or *right-handed* screw, which turns in the opposite direction.—**Male screw.** See *male*[1].—**Metric screw,** a screw in which the pitch is commensurable in units or fractions of a unit of the French metric system.—**Milled screw,** a screw with a flat broad head the edge of which is fluted, crenated, or roughened, to afford a firm hold for the fingers. Such screws are much used in chemical, philosophical, and electrical instruments, and in small machines.—**Perpetual screw.** Same as *endless screw* (which see, under *endless*).—**Plane screw.** See *plane*[1].—**Portland screw,** the cast of the interior of a fossil shell, *Cerithium portlandicum*. It consists of a number of spiral metal blades either cast together in one piece or bolted to a hub. In some special cases, as in ferry-boats, there are two screws, one at each end of the vessel. In some war-vessels transverse shafts with small propellers have been used to assist in turning quickly. An arrangement of screws now common is the twin-screw system, in which two screws are arranged at the stern, each on one of two parallel shafts, which are driven by power independently one of the other. By stopping or slowing up one shaft while the other maintains its

velocity, very rapid turning can be effected by twin screws, which have, moreover, the advantage that, one being disabled, the vessel can still make headway with the other. Some vessels designed to attain high speed have been constructed with three screws. A very great variety of forms have been proposed for screw-propeller blades; but the principle of the original true screw is still in use. Variations in pitch and modifications of the form of the blades have been adopted with success by individual constructors. The actual area of the screw propeller is measured on a plane perpendicular to the direction in which the ship moves. The outline of the screw projected on that plane is the actual area, but the effective area is, in good examples, from 0.2 to 0.4 greater than this; and it is the effective area and the mean velocity with which the water is thrown astern that determine the mass thrown backward. The mass thrown backward and the velocity with which it is so projected determine the propelling power. A kind of feathering propeller has also been used, but has not been generally approved. Scrophulariaceæ (skrof″ū-lā-ri-ā'sē-ē), *n. pl.* [NL. (Lindley, 1836), < *Scrophularia* + *-aceæ*.] An important family of dicotyledonous sympetalous plants, of the order *Polemoniales*, distinguished by a completely two-celled ovary with its placentæ on the middle partition, and by numerous seeds with fleshy albumen. The flowers have usually a persistent five-lobed calyx, a personate and irregularly inflated two-lipped corolla, four didynamous stamens borne on the corolla-tube, often with a staminode representing a fifth stamen, and an entire and sessile ovary which becomes a capsule opening by lines or terminal chinks, or rarely succulent and forming a berry. The family includes about 2,500 species, of 203 genera and 12 tribes, by many grouped in 3 subfamilies—the *Pseudosolaneæ*, with alternate leaves and flattish flowers, as the mullen, transitional to the *Solanaceæ* or nightshade family; the typical section, the *Antirrhinideæ*, as the snap-dragon, with opposite lower leaves and the upper lip exterior in the bud; and the *Rhinanthideæ*, including the foxglove and *Gerardia*, with various leaves and the lower lip exterior. The species are mainly herbs—a few, as *Paulownia*, becoming trees. Their leaves are entire or toothed, seldom lobed, and always without stipules. The inflorescence is either perfectly centripetal, commonly racemose, or primarily centripetal, the branches however bearing centrifugal clusters, either axillary or forming together a thyrsus. In some exceptional genera the corolla is spreading and nearly flat (see *Veronica*, *Verbascum*, *Limosella*); in many others the typical personate form becomes altered to a funnel-shaped or bell-shaped body, or to an inflated pouch or sac, often with a conspicuous spur. The order is well distributed through all parts of the world; it is most frequent in temperate and montane regions, but is also found within both arctic and tropical climates. About 50 genera are found in North America exclusive of Mexico—one, *Veronica*, extending within the arctic circle. Most species are acrid and bitter, and of suspicious or actively poisonous properties; many, as *Scrophularia* (the type), *Digitalis*, etc., yield remedies formerly or at present in repute. Several genera, as *Buchnera* and *Gerardia*, show a marked tendency to parasitism, dry black, resist cultivation, are in various species leafless, and connect with the parasitic family *Orobanchaceæ*. Others yield some of the most ornamental flowers of the garden. For the principal types of tribes, see *Verbascum*, *Antirrhinum*, *Chelone*, 2, *Gratiola*, *Digitalis*, *Gerardia*, and *Euphrasia*. The scrotum is a double bag, whose two cavities are separated by the septum scroti, which is indicated on the surface by a median seam or raphe. It consists of two layers—the skin, or integumentary layer, and the contractile layer, or dartos. The integument is very thin, brownish, provided with hairs and sebaceous follicles, and more or less corrugated or rugose, owing to the contraction of the dartos, which is a vascular layer containing a large amount of non-striated muscular tissue. All mammals whose testes leave the abdominal cavity have a scrotum, but in position, as well as in other particulars, it differs much in different cases. It is perineal, as in man, monkeys, dogs, etc.; or inguinal, as in the horse, bull, etc.; or abdominal, as in marsupials, in the position of the mammary pouch of the female. It may be sessile and little protuberant, or pendulous by a narrow neck, as in the bull, marsupials, etc. —**Raphe of the scrotum**. See *raphe*.

(*b*) In *entom.*, the third from before (or the penultimate one) of four pieces or sclerites composing any segment of the tergum of an insect, situated between the scutum and the postscutellum. There are three scutella, respectively of the pronotum, mesonotum, and metanotum, or one to each of the thoracic segments. That of the mesonotum (specifically the mesoscutellum, which see) is the most important in classification, and is generally meant when *scutellum* is said without qualifying term. It is variously modified: triangular in *Coleoptera*, sometimes invisible, at other times (as in some *Hemiptera*) large and covering the elytra and abdomen. (*c*) In *ornith.*, one of the large special horny plates, scales, or scutes with which the feet of most birds are provided, and which are generally arranged in a single vertical series upon the front, often also upon the back, of the tarsus and the tops of the toes: distinguished from the smaller or irregular plates which collectively constitute reticulation. The presence of such scutella constitutes scutellation, and a tarsus so furnished is said to be scutellate, as opposed to either a booted or a reticulate tarsus. The presence of scutella upon the back of the tarsus constitutes scutelliplantation — a condition rare in oscine birds, though usual in non-oscine *Passeres*, in *Picariæ*, etc. Also written *scutella*, with a plural *scutellæ*.—**Abdominal scutella, distinct scutellum, received scutellum.** See the adjectives.

The absence of dorsal spines chiefly distinguishes this family from *Spinacidæ*. There are 6 genera and few more species, the best known of which is the aberrant sleeper-shark, *Somniosus microcephalus*, of the arctic seas (by some referred to a distinct family), which often reaches a length of more than 15 feet, and generally approaches whaling-vessels, when whales are taken, to feed upon the blubber.

'by oneself,' orig. **swad*, abl. of the refl. pron. *se*, oneself (> *suus*, one's own), = Skt. *sva*, one's own self: see *se*[3].] A Latin prefix, meaning 'apart,' 'away,' occurring in many English words, as in *secede*, *secure*, *segregate*, *seclude*, *select*, *secret*, *seduce*, *separate*, *sever*, etc., and in the form *sed-* in *sedition*.

Some compare the word with L. *sævus*, wild, cruel, or with Gr. *aiólos*, movable; but there is no evidence to show that the name orig. implied 'raging water' or 'moving water.'] **1.** The salt waters that cover the greater part of the earth's surface; the ocean. [The word *sea* in compound words always has the meaning of 'ocean.' In this sense, with a hyphen, the word is the first element of numerous names, especially of animals and plants, the more noteworthy of which are entered in the following columns.]

The thridde day thei rode forth to the Rochell, and ther entred the *see*. *Merlin* (E. E. T. S.), iii. 419.

"Here is a royal belt," she cried,
"That I have found in the green *sea*."
Kemp Owyne (Child's Ballads, I. 144).

The sun 's a thief, and with his great attraction
Robs the vast *sea*. *Shak.*, T. of A., iv. 3. 440.

2. A great body of salt water; a more or less distinctly limited or landlocked part of the ocean having considerable dimensions. Such seas are frequently limited or separated from each other by linear groups of islands; this is especially the case on the Pacific coast of Asia, and in the East Indies, where there are more *seas* in this sense than anywhere else. Smaller areas thus more or less completely inclosed by land are known as *bays*, *gulfs*, *sounds*, etc. Thus, we speak of the Mediterranean *Sea* and, as a smaller division of this, the Adriatic *Sea*; but of the *Gulf* of Taranto, and the *Bay* of Naples. The name *sea* is not now usually given to entirely landlocked sheets of water—such use being either traditional, as in the Dead *Sea*, *Sea* of Galilee, or exceptional, as in the Caspian *Sea*, *Sea* of Aral. *Sea*, *bay*, and *gulf* are more or less synonymous terms. Thus, the Arabian *Sea* and the *Bay* of Bengal do not differ essentially in

the extent to which they are landlocked; the same may be said of the *Gulf* of Mexico and the Caribbean *Sea;* and Hudson's *Bay* might equally well, or even more properly, be called Hudson *Sea.*

sea-breeze (sē′brēz), *n.* A breeze blowing from the sea toward the land; specifically, in *meteor.*, a diurnal breeze felt near the sea-coast, setting in from the sea about 10 A. M., reaching its greatest strength from 2 to 3 P. M., and dying away about sunset. The sea-breeze and the corresponding land-breeze together constitute a local to-and-fro circulation due to the heating of the land above the ocean temperature during the day and the cooling below it during the night. The upper strata of the air that has become heated and expanded are carried away, leaving a diminished pressure for a short distance inland. This diminution of pressure initiates the sea-breeze, which extends a few miles inland, with a strength depending on the temperature-gradient and on the local topography. Hence it is most strongly marked in equatorial and tropical regions, where the diurnal range of temperature and the contrasts between ocean and land temperatures are greatest; but traces of it have been found even in arctic regions. Steep slopes and mountain-ranges near the coast intensify the sea-breeze by increasing the energy of convection-currents, which in turn create a demand for a greater local surface indraft. By kite observations in 1878 Abbe found the depth of the sea-breeze at Long Branch, N. J., to be about 400 feet, and by balloon observations in 1882 at Coney Island a similar result was attained. The velocity of the sea-breeze proper may reach 30 miles per hour in these localities. It is mainly the daily sea-breeze which renders the summer climate of the sea-shore attractive.

'of the sea'; cf. Gr. *ἅλς,* L. *sal,* the sea: see *sal*[1] and *salt*[1].] **1.** A marine carnivorous mammal of the order *Feræ,* suborder *Pinnipedia,* and family *Phocidæ* or *Otariidæ;* any pinniped not a walrus—for example, a hair-seal, a fur-seal, an eared seal, of which there are numerous genera and species. Seals are regarded as carnivores modified for aquatic life. The modification is profound, and somewhat parallel with that which causes certain other mammals, the cetaceans and sirenians, to resemble fishes in the form of the body and in the nature of the limbs. But seals retain a coat of hair or fur like ordinary quadrupeds, and an expression of the face like that of other carnivores. The body is more or less fusiform, tapering like that of a fish. It is prone, and can scarcely be lifted from the ground, so short are the limbs. These are reduced to mere flippers, especially in the true *Phocidæ,* in which the hind legs extend backward and cannot be brought into the position usual to mammals, but resemble the flukes of a cetacean. In the otaries (*Otariidæ*) the limbs are freer and less constrained. The latter have small but evident external ears, wanting in the former. The monk-seal, *Monachus albiventer,* lives in the Mediterranean and neighboring Atlantic, and a related species, *Monachus tropicalis,* is found between the tropics in Central American and West Indian waters. Another seal, *Phoca caspica,* inhabits inland waters of the Caspian, Aral, and Baikal. But with few exceptions all seals are maritime and also extratropical. They are especially numerous in high latitudes of the northern hemisphere. Among the *Phocidæ* may be noted *Phoca vitulina,* the ordinary harbor-seal or sea-calf, common in British waters and along the Atlantic coast of the United States; it is often tamed and exhibited in aquaria, being gentle and docile, and capable of being taught to perform some amusing tricks; it is one of the smaller species, usually from 3 to 5 feet long, and being the best-known, as well as wide-ranging, it has many local and fanciful names. *Phoca grœnlandica* (*Pagophilus grœnlandicus*) is the Greenland seal, or harp-seal or saddleback, peculiarly colored, of large size, and an important object of the chase. *Pagomys fœtidus* is a smaller species, the ringed seal or floe-rat of Greenland. *Erignathus barbatus* is the great bearded or square-flippered seal of Greenland, attaining a length of 8 or 10 feet. *Halichœrus gryphus* is a great gray seal of both coasts of the North Atlantic, of about the dimensions of the last named. *Histriophoca* is a genus containing the banded seal or ribbon-seal, *H. fasciata* or *H. equestris.* All the foregoing are members of the subfamily *Phocinæ. Cystophora cristata* is the hooded, crested, or bladder-nosed seal; this is a large seal, but the largest is the sea-elephant, *Macrorhinus proboscideus,* of southern seas; and these two genera form the subfamily *Cystophorinæ.* Certain seals of the southern hemisphere, of the genera *Lobodon, Stenorhynchus* (or *Ogmorhinus*), *Leptonychotes* (formerly *Leptonyx*), and *Ommatophoca,* form the subfamily *Stenorhynchinæ;* some of these are known as *sea-leopards* from their spotted coloration, and others as *sterrincks.* All the foregoing are *Phocidæ,* or earless seals, and they are also hair-seals. But the distinction between hair-seals and fur-seals is not, properly, that between *Phocidæ* and *Otariidæ,* but between those members of the latter family which do not and those which do have a copious under-fur of commercial value. The larger otaries are of the former character; they belong to the genera *Otaria, Eumetopias,* and *Zalophus,* are of great size, and are commonly called *sea-lions;* they are of both the northern and the southern hemisphere, chiefly in Pacific waters, and do not occur in the North Atlantic. The southern fur-seals or sea-bears are species of *Arctocephalus,* and among the smaller otaries. The fur-seal of most economic importance is the North Pacific sea-bear, *Callorhinus ursinus.* Some genera of fossil seals are described. The most important seal-fisheries are those on the Alaskan coast of the United States. On account of the attacks made by Canadians and others upon the seals in the open sea during their migrations to the Pribyloff Islands for the purpose of breeding, the United States endeavored to secure by agreement with Great Britain a season during which the seals should not be molested. This effort failed through the opposition of Canada. The United States then claimed that the waters within which the depredations were committed are within their jurisdiction, and on this ground seized several Canadian vessels. The dispute was submitted to arbitrators who met at Paris in 1893. They denied the United States claim of jurisdiction, awarded damages to Great Britain for the captured vessels, established a close season (May 1–July 31), and prohibited pelagic sealing within sixty miles of the Pribyloff Islands, and sealing in steam-vessels or with firearms. See cuts under *Cystophorinæ, Erignathus, Eumetopias, fur-seal, harp-seal, otary, Pagomys, Phoca, ribbon-seal, sea-elephant, sea-leopard, sea-lion,* and *Zalophus.*

In the middle ages seals were either impressed in wax run on the surface of the document, or suspended by cord or strips of parchment, as in the papal bulls. (See *bull*[2], 2.) In some jurisdictions an impression on the paper itself is now sufficient, and in others the letters *L. S.* (*locus sigilli,* the place of the seal) or a scroll or a mere bit of colored paper (see def. 3) are equivalent. In the United States the seal of a corporation or of a public officer may be by impression on the paper alone.

Cf. *sation*, a doublet of *season*. In def. 3 the noun is from the verb.] 1. A particular period of time. Specifically—(*a*) One of the periods into which the year is naturally divided by the annual motion of the sun in declination, or by the resulting characteristics of temperature, moisture, conditions of vegetation, and the like. Astronomically the year is divided into four nearly equal seasons, spring, summer, autumn, and winter, reckoned solely with respect to the sun's motion—spring beginning when the sun crosses the equator going northward, summer when it reaches the summer solstice, autumn when it crosses the equator going southward, and winter when it reaches the winter solstice. But popularly and historically the seasons refer to the four well-marked periods which in temperate regions are exhibited in the annual changes of climate and stages of vegetation. In consequence, the times of division and the duration of the seasons are entirely conventional, and are adjusted in terms of the monthly calendar in accordance with the local cli-

mate. In the United States and Canada spring is considered to begin with the first of March, and summer, autumn, and winter with the first of June, September, and December respectively. In Great Britain spring is regarded as beginning with February, summer with May, etc. In the southern hemisphere the summer season is simultaneous with the northern winter, and the periods of the other seasons are similarly interchanged. Within the tropics the annual variation of temperature is not so marked as that of humidity and rainfall, and, according to the locality, sometimes two, sometimes three, and sometimes four climatic seasons are distinguished, termed the *rainy* season, the *dry* season, etc.

In a somer *seson*, whan soft was the sonne.

sea-trumpet (sē′trum″pet), *n.* **1.** A medieval musical instrument essentially similar to the monochord, but suggestive of the viol. It consisted of a wooden body about 6 feet long, flat in front, polygonal behind, and tapering from a somewhat large flat base, which could be rested on the floor, to a short thick neck, terminating in a head with a tuning-screw. It had but one large string, made of gut, stretched over a peculiar bridge, and tuned to a low pitch, usually about that of the second C below middle C. The bridge was made so as to rest firmly on only one foot, the other being free to vibrate upon the body. The instrument was played with a large bow, like that of a violoncello. The tones used were the natural harmonics of the string, produced by lightly touching the nodes. Its scale therefore coincided with that of the trumpet; and this fact, taken in connection with its general shape, probably suggested its name. It was used for both sacred and secular music, both alone and in sets of three or four. It was especially common in nunneries as an accompaniment for singing, since its tones corresponded in pitch with those of the female voice. The latest specimens date from early in the eighteenth century. The instrument is important in connection with the development of the viol. Also *marine trumpet, tromba marina, nuns'-fiddle,* etc.

See *induction*, 6.—**Secondary colors**, in a fanciful theory of colors formerly in some vogue, colors produced by the mixture of any two primary colors in equal proportions, as green, formed of blue and yellow, orange, of red and yellow, or purple, of red and blue. All this, however, is now discarded as inconsistent with fact; since yellow is not a primary color, the mixture of blue and yellow is never more than greenish, and often pink, etc.—**Secondary consciousness**, reflective consciousness; consciousness trained to self-observation.—**Secondary conveyance**, in *law*, same as *derivative conveyance*. See *conveyance*.—**Secondary creditor.** See *creditor*.—**Secondary current**, in *elect.*, the current induced in a closed circuit, the secondary circuit, by a variation or alternation of the current in another circuit in inductive relation to the former. The secondary qualities are properly fourteen in number—namely, heavy and light, dense and rare, thick and thin, hard and soft, sticky and friable, rough and smooth, coherent and slippery. Color, smell, and taste are also secondary qualities. (*b*) In *modern philos.*, since Galileo (who in 1623 calls the qualities known as primary "primi accidenti") and Boyle (who in 1666 uses the term "secondary qualities, if I may so call them," in precisely the modern signification), affections of bodies; affective, patible, sensible qualities; imputed qualities; qualities of bodies relative to the organs of sense, as color, taste, smell, etc.: opposed to those characters (called *primary qualities*, though properly speaking they are not qualities at all) which we cannot imagine bodies as wanting. This classification was improved by Werner, who intercalated a "Transition series" between the primary and the secondary. See *Mesozoic, Paleozoic, Tertiary,* and *Transition.*

3. An officer of state who is charged with the superintendence and management of a particular department of government. (*a*) In the British government there are five secretaries of state—namely, those for the home, foreign, colonial, war, and Indian departments. The Secretary of State for the Home Department has charge of the privy signet office, and is responsible for the internal administration of justice, the maintenance of peace in the country, the supervision of prisons, police, sanitary affairs, etc. The Secretary of State for Foreign Affairs conducts all correspondence with foreign states, negotiates treaties, appoints ambassadors, etc. The Colonial Secretary performs for the colonial dependencies similar functions to those of the Home Secretary for the United Kingdom. The Secretary of State for War, assisted by the Army Council, has the entire control of the army; the office dates from 1855, when the office of Secretary at War was merged into it. The Secretary for India governs the affairs of that country with the assistance of a council. Each secretary of state is assisted by two under-secretaries, one permanent and the other connected with the administration. The Chief Secretary for Ireland is not a secretary of state, though his office entails the performance of duties similar to those performed by the secretaries of state. (*b*) In the United States government eight of the executive departments are presided over by secretaries—namely, the Secretary of State, the Secretary of the Treasury, the Secretary of War, the Secretary of the Navy, the Secretary of the Interior, the Secretary of Agriculture, the Secretary of Commerce, and the Secretary of Labor—all members of the cabinet; their duties are described under the names of their respective departments. (See *department*.) Each State has also its Secretary of State, or corresponding officer.

secretary-bird (sek′rē-tā-ri-bėrd), *n.* A remarkable raptorial bird of Africa, with very long legs; the serpent-eater or crane-vulture. This bird appears to have been first named *Sagittarius* by Vosmaer in 1769; it is *le secrétaire, le messager*, and *le mangeur de serpens* of early French writers, and *Falco serpentarius, Vultur serpentarius, Otis secretarius*, and *Vultur secretarius* of ornithologists of the last century. Between 1797 and 1817 four different generic names were based upon this type (see *Sagittarius*); and since 1800 five specific names have been added (*reptilivorus, africanus, capensis, gambiensis*, and, erroneously, *philippensis*)—the various combinations of the New Latin generic and specific names being now about twenty. The earliest tenable generic name (see *onym*) is *Serpentarius* of Cuvier; the earliest tenable specific name is *serpentarius* (Miller, 1785). Some strict constructionists of nomenclatural rules would combine these in the tautology of *Serpentarius serpentarius*, a form which has been introduced sparingly into the present work, simply to recognize its existence. The next specific name in chronological order is *secretarius* of Scopoli, 1786, yielding with the proper generic name the unexceptionable

Secretary-bird (*Serpentarius secretarius*).

onym *Serpentarius secretarius*. The name *secretary* refers to the bird's crest, which when lying smoothly on the head has been likened to a scribe's pen stuck over the ear; and this is also the explanation of *Sagittarius*. The term *crane-*

vulture (a reflection of Illiger's genus *Gypogeranus*) indicates the long legs like those of a grallatorial bird; *Serpentarius*, *Ophiotheres*, and *reptilivorus* describe the bird's characteristic habit of feeding upon snakes. Most of the remaining designations are place-names (one of them, *philippensis*, a blunder). The systematic position of this isolated type has been much discussed. It has usually been put in the *Raptores*, as a member of either of the families *Falconidæ* or *Vulturidæ*, or as forming a separate family called *Serpentariidæ* or *Gypogeranidæ*. Cuvier put the bird among waders, next to the boat-billed herons (*Cancroma*). The late Dr. H. Schlegel of Leyden thought it was a goshawk, and called it *Astur secretarius*. The expert of the British Museum in the latest official lists locates it next to the cariama (which is transferred to the family *Falconidæ* on the strength of the supposed relationship). The appearance of the secretary-bird is somewhat suggestive of the hoactzin (see cuts under *hoactzin* and *Opisthocomus*). It is about 4 feet long from the tip of the bill to the end of the tail; the wing from the carpal joint to the point measures 25 inches; the tail is about as long as this, the tarsus 13½ inches. The general color is ashy-gray; the flight-feathers, the feathered part of the legs, and the lower belly are black; the breast and under wing- and tail-coverts are whitish, more or less shaded with ashy; the two middle tail-feathers are longer than the rest, white-tipped, and with subterminal black bar. There is a bare orange-yellow space about the eyes; the iris is hazel; the shanks are flesh-colored. The long crest of black or gray black-tipped feathers springs from the hindhead and nape; these feathers are somewhat spatulate, and dispart when the crest is erected under excitement. The serpent-eater has a very capacious gullet and crop, capable of holding at once several snakes two or three feet long; it also eats other reptiles, as lizards, frogs, toads, and young tortoises. It is said to attack large serpents by grasping them in its talons and striking blows with the wings until it can deal a decisive thrust with the beak upon the head of its prey. The bird has often been tamed by the Dutch colonists, and kept to rid their premises of vermin.

2. In *animal* and *vegetable physiol.*, to produce, prepare, or elaborate by the process of secretion — the product thus derived from the protoplasm being a substance not previously existing, the character of which depends upon the kind of organ which acts, or on the manner in which the secretory operation is carried on.

The product or secretion usually consists of substances previously existing in the blood, such as water, salts, etc., combined with others which have been elaborated by the glandular epithelium from more or less different substances in the blood. The secretion may be eliminated from the body as detrimental, as urine, or it may be used, as the digestive secretions, to serve requirements of the organism or (as the milk) those of its offspring. Secretions which are merely eliminated as detrimental are called *excretions*. The act of secreting seems, in most instances at least, to be a vital act of the glandular epithelium, and is often, if not always, under direct nervous control. (*b*) In vegetable physiology, the process of giving off, by the protoplasm, of substances of either gaseous, liquid, or solid character, which play a further rôle in the life of the plant. Among plant-secretions may be mentioned enzymes, as diastase, emulsin, lipase, bromelin, etc.; mucilage; ethereal oils; nectar; and resins. In many instances, crystals are doubtless to be considered as true secretions rather than as simple excretions — which differ from secretions in not playing any part in the plant economy after being once formed. The distinction between *secretions* and *excretions* in plants is often a difficult one; hence many botanists fail to make any distinction between the two processes.

2. A substance or product secreted, or elaborated and emitted.—**Pancreatic secretion.** See *pancreatic*.=**Syn.** *Excretion*, *Secretion*. See *excretion*.

sect[1] (sekt), *n.* [< ME. *secte* (= D. *sekte* = MLG. *secta*, *secte* = MHG. *secte*, G. *secte*, *sekte* = Sw. Dan. *sekt*, < F. or L.), < OF. *secte*, F. *secte* = Pr. Sp. *secta* = Pg. *secta*, *seita* = It. *setta*, a sect in philosophy or religion, < LL. *secta*, a sect in philosophy or religion, a school, party, faction, class, gild, band, particularly a heretical doctrine or sect; in ML. in general a following, suite, a suit at law, a part, train, series, order, suit of clothes, etc.; L. *secta*, a school or set of doctrines (in philosophy), in earliest use a mode of life, a way, most frequently in the phrase *sectam* (*alicujus*) *sequi* or *persequi*, 'follow (some one's) way' (whence *sectam* (*alicujus*) *secuti*, 'those following (some one's) way,' one's party, sect, or faction), where *secta* is prop. 'a way, road,' lit. 'a way cut through,' being orig. pp., *secta* (sc. *via*, way), fem. of *sectus*, pp. of *secare*, cut, as used in the phrase *secare viam*, take one's way, travel one's road, lit. 'cut one's way' (cf. Gr. *τέμνειν ὁδόν*, cut one's way, take one's way): see *secant*, *sect*[2], *section*. Cf. ML. *rupta*, a way, road, orig. a road broken through a forest: see *rout*[5], *route*[1], *rut*[1]. The L. *secta* has been explained otherwise: (*a*) According to Skeat and others, lit. 'a follower' (= Gr. *ἑπέτης*, a follower), with formative *-ta*, < *sequi* (√*sequ*, *sec-* as in *secundus*, etc.) (= Gr. *ἕπεσθαι*), follow: see *sequent*. But *secta* is never used in the sense of 'follower,' and the phrase *sectam alicujus sequi* cannot be translated 'follow some one's follower.' (*b*) L. *secta*, lit. 'a following,' formed from *sequi* as above; but this is equally untenable. The notion of 'a following,' however, has long been present in the use of the word, as in the ML. senses: see above, and cf. *sectator*, *suit*, *suite*, ult. < L. *sequi*, follow. (*c*) The notion that L. *secta* is lit. 'a party cut off,' namely from the true, orthodox, or established church, and thus implies schism and heresy (cf. *sect*[2]), is entirely groundless. Cf. *sept*[1].] **1.** A system or body of doctrines or opinions held by a number of persons and constituting the distinctive doctrines of a school, as propounded originally by the founder or founders of the school and (usually) developed or modified by later adherents; also and usually, the body of persons holding such doctrines or opinions; a school of philosophy or of philosophers: as, the *sect* of Epicurus; the *sect* of the Epicureans.

As of the *secte* of which that he was born
He kepte his lay, to which that he was sworn.
Chaucer, Squire's Tale, l. 10.

The academicks were willing to admit the goods of fortune into their notion of felicity; but no *sects* of old philosophers did ever leave a room for greatness. *Dryden*.

When philosophers in after-times embraced our religion, they blended it often with the peculiar notions of those *sects* in which they had been educated, and by that means corrupted the purity and simplicity of the Christian doctrine. *Bp. Atterbury*, Sermons, I. iv.

2. A party or body of persons who unite in holding certain special doctrines or opinions concerning religion, which distinguish them from others holding the same general religious belief; a distinct part of the general body of persons claiming the same religious name or origin; especially, such a party of innovators, differing in their beliefs from those who support the older or orthodox views; a party or faction in a religious body; a separate ecclesiastical organization; an ecclesiastical denomination: as, the *sects* of the Jewish religion (which were not separately organized); the *sects* of the Christian church (usually separately organized); Mohammedan *sects;* Buddhist *sects*. The Latin word *secta*, from which the English word *sect* is derived, did not at first become limited in Christian usage to a specific meaning. It was used for 'way,' 'mode of life,' etc., but also for the Greek *αἵρεσις* (Latin *hæresis*, the original of the English word *heresy*), signifying 'a school of philosophy, opinion, or doctrine,' especially peculiar or erroneous doctrine. A familiar application was to the sect of Christians, as distinguished from Jews and pagans. In four of the nine passages in which *αἵρεσις* is found in the New Testament, the Vulgate has *hæresis*, in the other five *secta*. In Acts xxiv. 14 it has "the way (*sectam*) which they call heresy (*hæresim*)." The use of *secta* in these passages led to the meaning of 'a separate or heretical body,' which is found in writers of the fourth century, and by desynonymization *secta* emphasized the organization and *hæresis* the doctrine. Afterward it came to be supposed that the word *secta* meant, etymologically, 'a party cut off'; hence the more or less opprobrious use of *sect* by many writers. It is often used, however, unopprobriously, in a sense substantially identical with the original sense, to signify 'a body of persons who agree in a particular set of doctrines.'

Specifically—**2.** A member or an adherent of a sect in religion; a sectarian: often used opprobriously by those who regard as mere sects all bodies of Christians outside of their own.

Sects may be in a true Church as well as in a false, when men follow the Doctrin too much for the Teachers sake, whom they think almost infallible; and this becomes, through Infirmity, implicit Faith; and the name *Sectary* pertains to such a Disiple. *Milton*, True Religion.

Sir H. Wotton, Reliquiæ, p. 80.

2. A part cut or separated, or regarded as separated, from the rest; a division; a portion. Specifically—(*a*) A distinct part or division of a book or writing; a subdivision of a chapter; a division of a law or other writing; a paragraph. (*b*) In *music*, one of the equal and more or less similar divisions or parts of a melody or movement. The term is used inconsistently to describe either the half of a phrase or a double phrase. (*c*) A distinct part of a country or nation, community, class, or the like; a part of territory separated by geographical lines or of a people considered as distinct.

The extreme *section* of one class consists of bigoted dotards, the extreme *section* of the other consists of shallow and reckless empirics. *Macaulay*.

3. The curve of intersection of two surfaces.—**4.** A representation of an object as it would appear if cut by any intersecting plane, showing the internal structure; a diagram or picture showing what would appear were a part cut off by a plane supposed to pass through an object, as a building, a machine, a biological structure, or a succession of strata. In mechanical drawing, a *longitudinal section* usually presents the object as cut through its center lengthwise and vertically, a *cross-section* or *transverse section* as cut crosswise and vertically, and a *horizontal section* as cut through its center horizontally. *Oblique sections* are made at various angles. Sections are of great importance in geology, as it is largely by their aid that the relations and positions of the various members of the different formations, both stratified and unstratified, are made intelligible. The geological structure of any region is best indicated by one or more cross-sections on which the groups of rocks are represented in the order in which they occur and with the proper dips, as well as the irregularities due to faults, crust-movements, and invasions by igneous masses, by which causes the stratigraphy of a region may be made so complicated and obscure as to be unintelligible without such assistance to its comprehension as is afforded by cross-sections.

Sections, cohorts, phalanges, tribes, etc., are frequently introduced between the family and the order, or between the family and the genus; but it is commoner to speak of *sections* of a genus (*i. e.*, subgenera). The sense corresponds to that of the word *coup* as much used by French zoölogists. The sections of many English entomologists often correspond to families as they are understood in continental Europe and the United States.

7. In *bot.*, a group of species subordinate to a genus: nearly the same as *subgenus* (which see).—**8.** In *fort.*, the outline of a cut made at any angle to the principal lines other than a right angle.—**9.** The sign §, used either (*a*) as a mark of reference to a foot-note, or (*b*), prefixed to consecutive numerals, to indicate divisions of subdivisions of a book.—**Abdominal section**, laparotomy.—**Angular sections.** See *angular*.—**Cæsarean, conic, dominant section.** See the adjectives.—**Frontal section.** See *frontal plane*, under *frontal*.—**Frozen section**, a cutting of frozen parts, or that which is cut while frozen; especially, the surface of such cutting. It is much used in anatomy to show the exact relations of soft parts which might be disarranged or distorted if cut in their natural state.—**Golden, macrodiagonal, principal section.** See the adjectives.—**Harmonic section**, the cutting of a straight line at four points harmonically situated.—**Microscopic section.** See def. 5, and *section-cutter*.—**Normal section.** See *normal*, 4.—**Pubic section**, symphyseotomy.—**Rhinocerotic section, ribbon sections, sagittal sections, serial sections, Sigaultian section, subcontrary section**, etc. See the adjectives.—**Vertical section.** ★See *orthograph.*=**Syn. 2.** *Division*, *Piece*, etc. See *part*, *n.*

They are usually smooth herbs, either erect or decumbent, often tufted or moss-like, and remarkable for their fleshy stems and leaves. The latter are of very varied shapes, usually entire or but slightly toothed, and either opposite, alternate, or whorled. The flowers are borne in cymes, usually white, yellow, or pink, sometimes purplish or blue. Many species are common in dry, barren, or rocky places where little else will grow. The 10 British species and some of the American are known as *stonecrop*. Many others, known in cultivation by the generic name, and favorites for ornamenting rockwork, filling vases, and covering walls, are valued for the permanence of their foliage, which resists drought. Several with stiff rosettes of thick leaves are used for bedding out in summer, or employed for decorative borders and to form permanent designs, mottos, and lettering. Many similar Mexican plants so used, and commonly confused with these, belong to the genus *Echeveria*, and are distinguished by their united five-furrowed corolla-tube. A similar habit occurs in the related genus *Sempervivum*. Several other species are in cultivation for their pink, purple, or scarlet flowers, and others for their variegated leaves mottled with white or yellow. Many species are remarkable for persistence of life, cut stems growing and even flowering when fastened on a wall, deriving nourishment from reserves in their lower leaves and succulent stem, especially *S. Telephium* (for which see *orpine*, 2), also called *live-for-ever* and *livelong*, and known as *Aaron's rod* because sometimes growing when pressed and apparently dried, and as *midsummer-men* because formerly used for divination on midsummer eve by setting up two stems to see if the one representing the lover will turn to the other. *S. acre*, the English wall-pepper, bird's-bread, creeping-jack, or pricket, an emetic and cathartic, is often cultivated in America as *moss, golden-moss*, or *love-entangle*, and *S. Sieboldii*, a Japanese species valued for its grayish-green whorled leaves, as *constancy*. *S. rupestre* is known in England as *jealousy*; and for *S. Anacampseros*, see *herb of friendship*, under *herb*. *S. album*, formerly esteemed in medicine and eaten cooked or as a salad, is known as *wormgrass* and *prickmadam*. *S. pulchellum* of the southern United States is sometimes cultivated under the name of *widow's-cross*. *S. ternatum*, the wild stonecrop of rocky places in Pennsylvania and southward, with white flowers and rounded ornamental leaves in threes, is also often cultivated. *S. telephioides*, from western New York southward, and the roseroot, in the Rocky Mountains and arctic America, are conspicuous on account of their growth in multitudes on high ledges of dry mountain-cliffs.

2. The seat of a bishop, whether an ordinary bishop, or a bishop of higher rank (metropolitan, etc., patriarch, pope); the local center of a diocese and of diocesan authority, or of a diocese and other subordinate dioceses; the city or locality from which ecclesiastical jurisdiction is exercised; hence, episcopal rank, authority, and jurisdiction as exercised from a permanent local center. The word *see*, from meaning any seat of dignity, came to apply specifically to the cathedra, or episcopal throne, situated in a cathedral, thence to the city which contained the cathedral and was the chief city of a bishop's diocese, and so in modern usage to the diocese itself. It differs from *diocese*, however, in that *diocese* represents the territorial province for the care of which the bishop is responsible (that is, where his duties lie), whereas *see* is the local seat of his authority, dignity, and episcopal privileges. Both words differ from *bishopric*, in that *bishopric* represents the bishop's office, whether actual or nominal. See *throne*.

The fertilized and matured ovule of the higher or flowering plants. It is a body within the pericarp or seed-vessel, containing an organized embryo, or nucleus, which, on being placed under favorable circumstances, develops into an individual similar to that from which it came. The reproductive bodies of the lower or flowerless plants (cryptogams) differ in their mode of germination and in other ways, and are not called true seeds, but *spores*. (See *spore*.) The seed-coats are those of the ovule — two, or rarely only one. The outer, answering to the primine, is the more firm and is not rarely crustaceous in texture, and takes the name of *testa* (also *spermoderm* and *episperm*). The inner, answering to the secundine, is called *tegmen* (sometimes *endopleura*); when present, it is always conformed to the nucleus, and is thin or soft and delicate in texture. The seed-stalk or podosperm, when there is one, is the pedicel or attachment of the seed to the placenta, and answers to the funiculus of the ovule. The chalaza, raphe, and hilum of the ovule retain the same names in the seed. The foramen of the ovule is called the *micropyle* in the seed. The terms which denote the position of the ovule, such as *orthotropous*, *anatropous*, *amphitropous*, etc., also apply equally to the resulting seed. The nucleus may consist of the embryo alone, or of the embryo and the albumen, which is the nourishing substance upon which the developing plant is to feed until it is capable of maintaining itself. See the various terms, and cuts under *anatropous*, *campylotropous*, *Cruciferæ*, and *plumule*.

=Syn. 2. *Seem*, *Look*, *Appear*. *Look* differs from *seem* only in more vividly suggesting the use of the eye, literally or figuratively: as, it *looks* (or *seems*) right. *Appear* is somewhat stronger, having sometimes the sense of coming into view or coming to seem. Each may stand for that which is probably true, or in opposition to that which is true: not to *seem*, but to *be;* the *seeming* and the *real*. *Should seem* and *would seem* are equally correct, but differ in strength. To say that a thing *should seem* to be true is to say that it ought to seem so or almost necessarily seems so; to say that it *would seem* true is to say that, while there are reasons for holding an opposite view, the preponderance of evidence is on the side of its being true.

Before this occurs, however, the vegetal unit, if it does not divide, may *segment* or bud; the bud grows into a unit similar to its parent, and this in its turn may also *segment* or bud. *Bastian*, The Brain as an Organ of Mind, i.

II. *trans.* To separate or divide into segments: as, a *segmented* cell.

segmenta, *n.* Plural of *segmentum*.

segmental (seg′men-tal), *a.* [< *segment* + *-al*.] 1. Having the form of the segment of a circle; being a segment: as, a *segmental* arch.—2. Of or pertaining to segments or segmentation: as, a *segmental* formula; *segmental* parts; *segmental* organs.—3. Specifically, in *embryol.*, noting the primitive and rudimentary renal organs which occur in all vertebrates and some invertebrates, consisting in the former of branched tubules opening at one end into the somatic cavity and at the other by one or more main ducts into the cloaca or hindgut. The segmental organs of a vertebrate are divisible into three parts, anterior, middle, and posterior. The foremost is the head-kidney or *pronephros*, whose duct becomes in part the Müllerian duct. The next is the Wolffian body proper, or *mesonephros*, whose duct is the Wolffian duct. The last or hindmost is the rudiment of the permanent kidney, whose duct is the ureter; this is the *metanephros*. The epithet *segmental* in this sense was originally used to note the kind of renal or excretory organs which annelids, as worms and leeches, possess, in more or fewer of the segments of the body, whence the name; it was subsequently extended to the above-described embryonic renal organs of vertebrates which are replaced by permanent kidneys—these segmental organs being thus loosely synonymous with *primitive kidney* and *protonephros*. See cut under *leech*.

segmentally (seg′men-tal-i), *adv.* In a segmental manner; in segments: as, the spinal nerves are arranged *segmentally*.

These organs, being . . . *segmentally* arranged, are termed segmental organs or nephridia.

segmentation (seg-men-tā′shon), *n.* [< *segment* + *-ation*.] The act of cutting into segments; a division into segments; the condition of being divided into segments; the manner in which a segmented part is divided.—**Segmentation cavity,** in *embryol.*, the central space inclosed by the blastomeres of the embryo, before the formation of a gastrula by invagination; the hollow of a blastosphere; a blastocœle.—**Segmentation nucleus,** the nucleus of an impregnated ovum or germ-cell, resulting from fusion of a male and a female pronucleus, and capable of undergoing segmentation.—**Segmentation of the vitellus,** in *embryol.*, yolk-cleavage; morulation; the first process of germination of the ovum of any metazoic animal, by which the original single cell of which the ovum primitively consists becomes converted, wholly or in part, into a mass of similar cells, constituting a morula or mulberry-mass. The cells thus formed are specified as *cleavage-cells*, *blastomeres*, or *segmentella*. Segmentation goes on in different cases with some variations, chiefly due to the presence of food-yolk and the position of this yolk relatively to the formative yolk (see *centrolecithal*, *ectolecithal*). *Total* segmentation is necessarily restricted to holoblastic ova; it is distinguished from the *partial* segmentation of meroblastic ova (see *holoblastic*, *meroblastic*), the terms meaning respectively that all, or that only some, of the yolk segments. Total segmentation is *equal* or *regular* when the whole germ-cell divides into two similar cleavage-cells, and these into four, and so on, the resulting gastrula being the archigastrula. Total segmentation is *unequal* or *irregular* when the cleavage-cells are unlike one another; it results in the amphigastrula. The partial segmentation of meroblastic eggs is always unequal, and either *discoidal* with formation of a discogastrula, or *superficial* and forming a perigastrula. Total equal segmentation is also styled *primitive*, *primordial*, and *palingenetic*, the modifications introduced in unequal and partial segmentation being described as *kenogenetic*. Other terms, descriptive rather than definitive, are used by different writers; the foregoing is nearly Haeckel's nomenclature. See *egg*[1], *ovum*, *vitellus*, and cuts under *gastrula* and *gastrulation*.—**Segmentation rhythm,** the rate of production of successive cleavage-cells, or their numerical ratio of increase, whether 2, 4, 8, 16, 32, etc., or any other mode of multiplication.—**Segmentation sphere,** a ball of cleavage-cells; a blastosphere; a morula.

segmented (seg′men-ted), *a.* [< *segment* + *-ed*[2].] Divided into segments, segmenta, or segmentella; characterized by or exhibiting segmentation; somitic; metameric: thus, the body of a vertebrate is *segmented* according to the number of vertebræ, whether any actual division of parts may be evident or not.

If government, however, throws the expense of coinage, as is reasonable, upon the holders, by making a charge to cover the expense (which is done by giving back rather less in coin than is received in bullion, and is called "levying a *seigniorage*"), the coin will rise to the extent of the *seigniorage* above the value of the bullion. *J. Seines vary in size from one small enough to take a few minnows to the shad-seine of a mile or more in length, hauled by a windlass worked by horses or oxen or by a steam-engine. The largest known seine was used for shad at Stony Point on the Potomac in 1871; it measured 3,400 yards, or nearly 2 miles; the lines and seine together had a linear extent of 5 miles, and swept 1,200 acres of river-bottom; this net was drawn twice in 24 hours.

They are branched moniliform rows of roundish or oval spores, resulting from the division of terminal cells of particular branches, or produced on the main branches.

seismal (sīs′mal), *a.* [< Gr. *σεισμός*, an earthquake (< *σείειν*, shake, toss), + *-al*.] Same as *seismic*.

seismic (sīs′mik), *a.* [< Gr. *σεισμός*, an earthquake, + *-ic*.] Pertaining to or of the nature of an earthquake; relating to or connected with an earthquake, or with earthquakes in general. To a considerable extent, *seismic* takes the place of *earthquake* used as an adjective or in compound words. Thus *seismic center* is the equivalent of *earthquake center*, etc.—**Seismic area**, the region or part of the earth's surface affected by the shock of an earthquake.—**Seismic center**, or **seismic focus**, the place beneath the earth's surface where an earthquake-shock is started or originated.—**Seismic vertical**, the earth's radius which connects the seismic center with the surface; the shortest path of the shock to the surface. See *earthquake* and *epicenter*.

seismogram (sīs′mō-gram), *n.* [< Gr. *σεισμός*, an earthquake, + *γράμμα*, that which is drawn or written: see *gram*[2].] The record made by ★ a seismograph.

seismograph (sīs′mō-grâf), *n.* [< Gr. *σεισμός*, an earthquake, + *γράφειν*, write.] An instrument for recording earthquakes or other seismic phenomena. Among the many forms of seismographs worthy of mention on account of their wide distribution and accurate records, is the Omori seismograph, a form of horizontal pendulum first suggested by James E. Ewing, modified by Gray and Omori, and now made in its best form by Bosch of Strassburg. It consists of a steady mass that remains as nearly as possible at rest during the few seconds required for the passage of an earthquake-shock. A pen attached to the steady mass records the relative movement of the earth. See the supplement. The most delicate seismograph consists of a non-magnetic needle suspended horizontally by silk or quartz fiber as in the magnetograph; the relative motion of the quiet needle and the earth is recorded on a magnified scale photographically, on the same sheet with the magnetogram, and enables the magnetist to distinguish between true magnetic disturbances and earthquake records.

seismographer (sīs-mog′ra-fėr), *n.* Same as *seismologist*. [Rare.]

seismographic (sīs-mō-graf′ik), *a.* [< *seismograph-y* + *-ic*.] Of or pertaining to seismography; connected with or furnished by the seismograph: as, *seismographic* records, observations, studies, etc.

seismological (sīs-mō-loj′i-kal), *a.* [< *seismology* + *-ic-al*.] Relating to or connected with seismology, or the scientific investigation of ★ the phenomena of earthquakes.

> The object of all *seismological* investigation should be, primarily, to determine both the true direction and velocity of motion of the particles set in motion by the earthquake-wave. *Oldham*, Cachar Earthquake, p. 90.

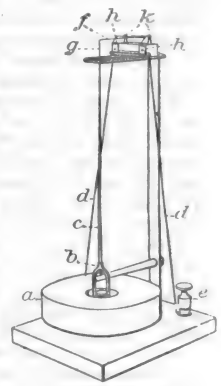
seismologue (sīs′mō-log), *n.* [< Gr. *σεισμός*, an earthquake, + *-λόγος*, < *λέγειν*, speak: see *-ology*.] A catalogue of earthquake observations; a detailed account of earthquake phenomena.

> The labour of collecting and calculating further and future *seismologues* will be in a great degree thrown away, unless the cultivators of science of all countries . . . shall unite in agreeing to some one uniform system of seismic observation.
> *R. Mallet*, in Trans. Brit. Ass. for Adv. of Sci., 1858, p. 1.

seismology (sīs-mol′ō-ji), *n.* [< Gr. *σεισμός*, an earthquake, + *-λογία*, < *λέγειν*, speak: see *-ology*.] The branch of science which has for its object the investigation of the causes and effects of earthquakes, and, in general, of all the conditions and circumstances of their occurrence.

> The objects and aims of *Seismology* are of the highest interest and importance to geology and terrestrial physics.
> *R. Mallet*, in Admiralty Manual of Scientific Enquiry (3d ed.), p. 327.



★ **seismometer** (sīs-mom′e-tėr), *n.* [< Gr. *σεισμός*, an earthquake, + *μέτρον*, a measure: see *meter*[1].] An instrument by the aid of which the data are obtained for the scientific study of earthquake phenomena. The forms of instruments used for this purpose are varied, and more or less complicated, in accordance with the wishes and means of the observer. A common bowl partly filled with a viscid fluid, like molasses, which, on being thrown by the earthquake-wave against the side of the bowl, leaves a visible record of the event, is one of the simplest forms of seismometer which have been proposed, as giving a rude approximation to the direction of the horizontal element of the wave. Another simple form of seismometer consists of two sets of cylinders, each set numbering from six to twelve, and the individual cylinders in each uniformly decreasing in size. These are placed on end, one set at right angles to the other, on plates resting on a hard horizontal floor, surrounded by a bed of dry sand, in which the cylinders when overthrown will rest, exactly in the position originally given by the shock. This instrument is theoretically capable of giving the velocity of the horizontal component of the shock, its surface-direction in azimuth, or the direction of the horizontal component of the seismic wave, and also the direction of translation of the wave. In practice, however, the results given by this simple and inexpensive apparatus have not been found satisfactory. The seismometer now most generally used in large observatories, or those where accurate work is expected, involves Zöllner's horizontal pendulum, the use of which was proposed many years ago, but which was put into the present practical form by Messrs. Ewing and Gray. The group of instruments constituting the seismometer of Prof. J. A. Ewing is arranged to give a complete record of every particular of the earthquake movement, by resolving it into three rectangular components—one vertical and two horizontal—and registering these by three distinct pointers on a sheet of smoked glass which is made to revolve uniformly by clockwork, the clock being started by an arrangement similar to that of the Palmieri seismoscope. To this is added another clock which gives the date of the shock and the interval which has elapsed since it took place. Another and simpler form of seismometer designed by Mr. Ewing, and called the "duplex-pendulum seismograph," does not show the vertical element of the disturbance, nor exhibit anything of the relation of time to displacement; but it is in other respects satisfactory in its performance. Of this latter form, fifteen sets were in use in Japan in 1886, and others were being made for other countries. Compare *seismograph*, and see cut under *seismoscope*.

> Instruments which will in this way measure or write down the earth's motions are called *seismometers* or seismographs. *Milne*, Earthquakes, p. 13.

seismometric (sīs-mō-met′rik), *a.* [< *seismometr-y* + *-ic*.] Of or pertaining to seismometry or the seismometer; used in or made, produced, or observed by means of a seismometer: as, *seismometric* instruments; *seismometric* observations.

seismoscope (sīs′mō-skōp), *n.* [< Gr. *σεισμός*, an earthquake, + *σκοπεῖν*, view.] A name of the simpler form of seismometer. It is generally so arranged that the exact moment of passage is noted by stopping a clock, either by direct mechanical means or by the use of an electric current. The epoch may also be registered on a revolving cylinder or other similar device. The essential part of a seismoscope usually consists of a delicately suspended or balanced mass, the configuration of which is readily disturbed on the passage of the seismic wave.

> To construct an instrument which at the time of an earthquake shall move and leave a record of its motion, there is but little difficulty. Contrivances of this kind are called *seismoscopes*. *Milne*, Earthquakes, p. 13.

Selagineæ (sel-a-jin′ē-ē), *n. pl.* [NL. (Jussieu, 1806), < *Selago* (*-gin-*) + *-eæ*.] A small tribe of scrophulariaceous plants, characterized by flowers with a corolla of five or sometimes four equal or unequal spreading lobes, four didynamous or two equal stamens, one-celled anthers, and a superior one- or two-celled ovary, forming one or two small nutlets in fruit, often with a fleshy surface and corky furrowed or perforated interior, investing a pendulous cylindrical seed with fleshy albumen. It has been given family rank by most botanists (Jussieu, Endlicher, Bentham and Hooker, etc.), and Lindley used the form *Selaginaceæ*, in which he was followed by de Candolle. It includes about 156 species belonging to 6 genera, of which *Selago* is the type. They are chiefly diminutive heath-like shrubs of South Africa, with alternate, narrow, and rigid leaves, and small flowers grouped in terminal spikes or dense globular heads, commonly white or blue, rarely yellow.

Selaginella (sē-laj-i-nel′ä), *n.* [NL. (Palisot de Beauvois, 1805), dim. of L. *Selago* (*-gin-*), a genus separated from *Lycopodium*, lycopodium: see *Selago*.] A genus of heterosporous vascular cryptogams, typical of the *Selaginellaceæ*. They have the general habit of *Lycopodium* (the ground-pine, club-moss, etc.), differing from it mainly by the dimorphic spores. The stems are copiously branched, trailing, suberect, sarmentose, or scandent; in shape they are more or less distinctly quadrangular, with the faces angled or flat. The leaves are small, with a single central vein, usually tetrastichous and dimorphous, and more or less oblique, the two rows of the lower plane larger and more spreading, the two rows of the upper ascending, adpressed, and imbricated; spikes usually tetrastichous, often sharply square, at the end of leafy branches; microsporangia numerous; macrosporangia few, and confined to the base of the spike. About 335 species have been described, from the warmer parts of the globe. Many species are cultivated in conservatories, and numerous forms have resulted. *S. lepidophylla* is well known under the name *resurrection-plant*, and shares with *S. convoluta* the name *rock-lily* or *rock-rose*.

Fertile Plant of *Selaginella lepidophylla*.

Selago (sē-lā′gō), *n.* [NL. (Linnæus, 1735), < L. *selago*, a similarly dwarf but unrelated plant, *Lycopodium Selago*.] A genus of scrophulariaceous plants, type of the tribe *Selagineæ*. It is characterized by flowers with a two- to five-lobed calyx, nearly regular or somewhat two-lipped corolla, four didynamous and perfect stamens, and a two-celled ovary which separates into two nutlets in fruit. There are about 80 species, natives of tropical and South Africa, and one, *S. muralis*, growing on the walls of the capital of Madagascar. They are dwarf heath-like shrubs, sometimes small annuals, often low and diffuse, and with many slender branchlets. They bear narrow leaves, commonly alternate and clustered in the axils, and sessile flowers in dense or slender spikes.

(Vulgate), < Heb. *selāh*, of unknown meaning; connected by Gesenius with *sālāh*, rest.] A transliterated Hebrew word, occurring in the Psalms frequently, and in Habakkuk iii.: probably a direction in the musical rendering of the passage. It is explained by most authorities as meaning 'Pause,' but occurs also at the end of psalms.

3. In *biol.*, the separation of those forms of animal and vegetable life which are to survive from those which are to perish; the facts, principles, or conditions of such distinction between organisms; also, the actual result of such principles or conditions; also, a statement of or a doctrine concerning such facts; especially, natural selection. See phrases below. — **Artificial selection**, man's agency in modifying the processes and so changing the results of natural selection; the facts or principles upon which such interference with natural evolutionary processes is based and conducted. This has been going on more or less systematically since man has domesticated animals or cultivated plants for his own benefit. Such selection may be either *unconscious* or *methodical* (see below). It has constantly tended to the latter, which is now systematically conducted on a large scale, and has resulted in numberless creations of utility or of beauty, or of both, which would not have existed had the animals and plants thus improved been left to themselves — that is, to the operation of natural selection. Examples of artificial selection are seen in the breeding of horses for speed, bottom, or strength, or for any combination of these qualities; of cattle for beef or milk; of sheep for mutton or wool; of dogs for speed, scent, courage, docility, etc.; of pigs for fat pork; of fowls for flesh or eggs; of pigeons for fancied shapes and colors, or as carriers; in the cultivation of cereals, fruits, and vegetables to improve their respective qualities and increase their yield, and of flowers to enhance their beauty and fragrance. — **Methodical selection**, artificial selection methodically or systematically carried on to or toward a foreseen desired result; the facts or principles upon which such selection is based, and the means of its accomplishment. See above.

Methodical selection is that which guides a man who systematically endeavours to modify a breed according to some predetermined standard.
Darwin, Var. of Animals and Plants, xx. 177.

In the case of *methodical selection*, a breeder selects for some definite object, and free intercrossing will wholly stop his work. *Darwin*, Origin of Species, p. 103.

Natural selection, the preservation of some forms of animal and vegetable life and the destruction of others, in the natural order of such things, by the operation of natural causes which, in the course of evolution, favor some organisms instead of some others in consequence of differences in the organisms themselves. (*a*) The fact of the survival of the fittest in the struggle for existence — which means that those animals and plants which are best adapted, or have the greatest adaptability, to the conditions of their environment do survive other organisms which are less adapted, or less capable of being adapted, to such conditions. This fact rests upon observation, and is unquestionable. (*b*) The means by which or the conditions under which some forms survive while others perish; the law of the survival of the fittest; the underlying principle of such survival, and the agencies which effect that result. These seem to be mainly intrinsic, or inherent in the organism; and they are correlated, in the most vital manner possible, with the varying plasticity of different organisms, or their degree of susceptibility to modification by their environment. Those which respond most readily to external influence are the most modifiable under given circumstances, and consequently the most likely to be modified in a way that adapts them to their surroundings, which adaptation gives them an advantage over less favored organisms in striving to maintain themselves. Hence (and this is the gist of Darwinian natural selection) — (*c*) The gradual development of individual differences which are favorable to the preservation of the life of the individual, with corresponding gradual extinction of those peculiarities which are unfavorable to that end; also, the transmission of such modified characters to offspring, and so the perpetuation of some species and the extinction of others — a fact in nature respecting which there is no question, since we know that more species, genera, etc., have perished than are now living. (*d*) The theory of natural selection; any statement of opinion or belief on that subject, which may or may not adequately reflect the facts in the case. Ignorance alike of these facts and of this theory has been fruitful of misunderstandings and objections respecting the latter. Some of its supporters have made of the theory a cause of the facts which it is simply designed to explain; some of its opponents, unconsciously biased perhaps by such other extremists, have denied that the theory has any validity. Between these extremes, the author of the theory states explicitly that it neither originates variability, nor accounts for the origin of variations, in individuals, still less in species; but that, given the origination and existence of variations, it shows that some of these are preserved while others are not; that favorable variations tend to be perpetuated and unfavorable variations to become extinct; that those variations which best adapt an organism to its environment are most favorable to its preservation; and, consequently, that the theory of natural selection is adequate to explain, to some extent, the observed fact of the survival of the fittest in the struggle for existence — that is, natural selection in sense (*a*) above. Natural selection, in so far as sex is concerned, is specified as *sexual selection* (see below). The facts and principles of natural selection, as recognized and used by man for his own benefit in his treatment of plants and animals, come under the head of *artificial selection* (see above). An extension of the theory of natural selection to the origination (as distinguished from the preservation) of individual variations has been named *physical selection* (see below).

This preservation of favourable variations and the rejections of injurious variations I call *Natural Selection*. Variations neither useful nor injurious would not be affected by *natural selection*, and would be left a fluctuating element, as perhaps we see in the species called polymorphic. *Darwin*, Origin of Species (ed. 1860), iv.

Natural selection . . . implies that the individuals which are best fitted for the complex and in the course of ages changing conditions to which they are exposed generally survive and procreate their kind.
Darwin, Var. of Animals and Plants, xx. 178.

Physical selection, the law of origin for differential changes or modifications in organisms which have arisen through the action of physical causes in the environment, in habits, etc. It is distinguished from *natural selection*, which relates not to the origin but to the preservation of these changes. *A. Hyatt.* — **Sexual selection**, that province or department of natural selection in which sex is especially concerned, or in which the means by which one sex attracts the other comes prominently into play. Thus, anything which exhibits the strength, prowess, or beauty of the male attracts the female, and decides her preference for one rather than another individual of the opposite sex, with the result of affecting the offspring for the better; and this principle of selection, operative through many generations, may in the end modify the specific characters of animals, and thus become an important factor in natural selection.

If it be admitted that the females prefer or are unconsciously excited by the more beautiful males, then the males would slowly but surely be rendered more and more attractive through *sexual selection*.
Darwin, Descent of Man (ed. 1881), p. 496.

For my own part, I conclude that of all the causes which have led to the differences in external appearance between the races of men, and to a certain extent between man and the lower animals, *sexual selection* has been by far the most efficient. *Darwin*, Descent of Man (ed. 1871), II. 367.

Unconscious selection, artificial selection effected unknowingly, or carried on without system or method; man's agency in unmethodical selection, or the result of that agency. See the extract.

Unconscious selection in the strictest sense of the word — that is, the saving of the more useful animals and the neglect or slaughter of the less useful, without any thought of the future — must have gone on occasionally from the remotest period and amongst the most barbarous nations.
Darwin, Var. of Animals and Plants, xx. 199.

The element was so called (by Berzelius) as chemically related to *tellurium* (< L. *tellus*, earth).] Chemical symbol, Se; atomic weight, 79.2. A non-metallic element extracted from the pyrite of Falun in Sweden, and discovered in 1817 by Berzelius. In its general chemical analogies it is related to sulphur and tellurium. It is found in combination with native tellurium, as in selen-tellurium, with sulphur in selen-sulphur; also in very small quantity in some of the varieties of iron pyrites, and in several rare selenides, as clausthalite, or lead selenide, etc. When precipitated it appears as a red powder, which melts when heated, and on cooling forms a brittle mass, nearly black, but transmitting red light when in thin plates. When heated in the air it takes fire, burns with a blue flame, and produces a gaseous compound, oxid of selenium, which has a most penetrating and characteristic odor of putrid horse-radish. Selenium undergoes a remarkable change in electrical resistance under the action of light: hence the use of selenium-cells. See *resistance*, 3, and *photophone*.

self (self), *a.*, *pron.*, and *n.* [Also Sc. *sel*, *sell*; < ME. *self*, *silf*, *seolf*, *sulf* (pl. *selfe*, *seolfe*, *selve*, *sulve*, *seolve*, later *selves*; in oblique cases *selven*), < AS. *self*, *seolf*, *silf*, *siolf*, *sylf*, same, self, = OS. *self* = OFries. *self*, *selva* = OD. *self*, D. *zelf* = MLG. *self*, *sulf*, LG. *sulv* = OHG. *selb*, MHG. *selp*, G. *selb* (inflected *selber*, etc.), *selbst* (uninflected) = Icel. *sjælfr*, *sjálfr* = Sw. *sjelf* = Dan. *selv* = Goth. *silba*, same, self; origin unknown: (*a*) in one view (Skeat) the orig. form **selba* is perhaps for **seliba*, 'left to oneself,' < *se-*, *si-* (Goth. *si-k* = L. *se*, oneself, = Skt. *sva*, one's own self), + *lib-*, the base of AS. *līfan*, be left, *lāf* = Goth. *laiba*, a remnant, etc. (see *leave*[1], *life*, *live*[1]). (*b*) In another view (Kluge) perhaps orig. 'lord, possessor, owner,' akin to Ir. *selb*, possession; cf. Skt. *patis*, lord, with Lith. *pats*, self; cf. also *own*[1], *v.*, *owner*, with the related *own*[1], *a.*, which in some uses is nearly equiv. to *self*. The use of *self* in comp. to form the reflexive pronouns arose out of the orig. independent use of *self* following the personal pronouns, and agreeing with them in inflection, in AS. as follows: *ic selfa* (*ic self*), 'I self' (I myself), *mīn selfes*, 'of me self' (of

myself), *mē selfum*, 'to me self' (to myself), *mē selfne*, 'me self' (myself), pl. *wē selfe*, 'we self' (we ourselves), etc.; so *thū selfa* (*thū self*), 'thou self' (thyself), *thīn selfes*, 'of thee self' (of thyself), etc., *hē selfa* (*hē self*), 'he self' (himself), *his selfes*, 'of him self' (of himself), etc., the adj. *self* becoming coalesced with the preceding pronoun in the oblique cases *mine, my, me, our, thine, thy, thee, your, his, him, her, their, them*, etc., these being ultimately reduced in each instance to a single form, which is practically the dative *me, thee, him, her, them*, etc. (in which the acc. was merged), mixed in part with the genitive *mine, my, our, thine, thy, your*, etc., these orig. genitives in time assuming the appearance of mere possessives, and *self* thus taking on the semblance of a noun governed by them, whence the later independent use of *self* as a noun (see III.). The reflexive combination *me selfe, him selfe* (*selve*), etc., came to be used, as the dative of reference, to indicate more distinctly the person referred to — 'I (for) my self,' 'he (for) him self,' etc., thus leading to the emphatic use. The former (AS. ME.) adj. pl. *-e* has now changed to the noun pl. *-es* (*selves*, as in *wolves, wives*, etc.). *Itself* and *oneself* retain the original order of simple juxtaposition: *it* + *self*, *one* + *self*. In the more common *one's self*, *self* is treated as an independent noun.] **I.** *a.* **1.** Same; identical; very same; very. [Obsolete or archaic except when followed by *same*. See *selfsame*.]

II. *pron.* A pronominal element affixed to certain personal pronouns and pronominal adjectives to express emphasis or distinction, or to denote a reflexive use. Thus, for emphasis, I *myself* will write; I will examine for *myself;* thou *thyself* shalt go; thou shalt see for *thyself;* the writing *itself* shall be exhibited. "I *myself* will decide" not only expresses my determination to decide, but my determination that no other shall decide. Reflexively, I abhor *myself;* he admires *himself;* it pleases *itself*. *Himself, herself, themselves* are used in the nominative case as well as in the objective. When the elements are separated by an adjective, *self* becomes a mere noun: as, *my* own *self*, *our* two *selves, his* very *self;* so *one's self* for *oneself*. See III.

Now chese *yourselven* whether that you liketh.

III. *n.*; pl. *selves* (selvz). **1.** A person in his relations to that very same person. *Self* differs from *ego* as being always relative to a particular individual, and as referring to that person in all his relations to himself and not merely as given in consciousness.

W. James, Prin. of Psychology, I. 400.

2. A thing or class of things, or an attribute or other abstraction, considered as precisely distinguished from all others: as, the separation of church and state is urged in the interest of religion's *self*.

4. In *hort.*, a flower with its natural plain color; a self-colored flower, as distinguished from one which has become "rectified" or variegated. Compare *self-colored*. [*Self* is the first element in numerous compounds, nearly all modern. It may be used with any noun having an associated verb, or with any participial adjective (in *-ing*[2] or *-ed*[2] or *-en*[1]), or other adjective implying action. It indicates either the agent or the object of the action expressed by the word with which it is joined, or the person on behalf of whom it is performed, or the person or thing to, for, or toward whom or which a quality, attribute, or feeling expressed by the following word belongs, is directed, or is exerted, or from which it proceeds; or the subject of, or object affected by, such action, quality, attribute, feeling, and the like; and the meaning is frequently negative, implying that the relation exists toward self only, not toward others: as, *self-acting*, etc. Most of these compounds are of obvious meaning; only the more important of them are given below (without etymology, except when of early formation). In words compounded with *self*, the element *self* has a certain degree of independent accent, generally less than that of the following element, but liable to become by emphasis greater than the latter.] — **By one's self.** See *by*[1]. — **To be beside one's self.** See *beside*. — **To be one's self**, to be in full possession of one's powers, both mental and physical.

Self-love is not despicable, but laudable, since duties to self, if self-perfecting—as true duties to self are—must needs be duties to others.

They are plants of peculiarly fleshy habit, in some species with a leaf-bearing stem, but in most stemless and consisting of a rosette of short and broad alternate fleshy and commonly revolute leaves. The flowers are white, red, green, yellow, or purple, and borne in panicled and commonly compactly flowered cymes. They are remarkable, like the related *Sedum*, for tenacity of life: *S. cæspitosum* is said to have grown when planted after being for eighteen months pressed in a herbarium. Those with shrubby stems have yellow or rarely white flowers, are all from the Canary Islands, are cultivated under glass, and show many divergences from the typical structure — some, as the subgenus *Greenovia*, having as many as thirty-two petals. The best-known species of outdoor cultivation are *S. globiferum* (see *hen-and-chickens*) and *S. tectorum* (the houseleek). Especially—(*a*) In ancient Rome, a body of citizens appointed or elected from among the patricians, and later from among rich plebeians also, or taking seats by virtue of holding or of having held certain high offices of state. Originally the senate had supreme authority in religious matters, much legislative and judicial power, the management of foreign affairs, etc. At the close of the republic, however, and under the empire, the authority of the senate was little more than nominal apart from certain administrative functions, chiefly fiscal, and from its sittings as a high court of justice and as an appellate tribunal. The original senate of the patricians numbered 100; after the adjunction of the tribes Tities or Sabines and Luceres, the number became 300, and remained at this figure for several centuries, with the exception of some temporary changes, until the supremacy of Sulla. Julius Cæsar made the number 900, and after his death it became over 1,000, but was reduced to 600 by Augustus, and varied under subsequent emperors. (*b*) The upper or less numerous branch of a legislature in various countries, as in France, Italy, the United States, and in all the separate States of the Union. The Senate of the United States consists of two senators from each State, and numbers 96 members. A senator must be at least thirty years of age, nine years a citizen of the country, and a resident of the State from which he is chosen. Senators were elected by the State legislatures, but an amendment to the Constitution for their (direct) election by popular vote was submitted by Congress to the States, was ratified by three fourths of the State legislatures, and became effective in 1913. Senators sit for six years, but the terms of office are so arranged that one third of the members retire every two years. In addition to its legislative functions, the Senate has power to confirm or reject nominations and treaties made by the President, and also tries impeachments. The vice-president of the United States is the president of the Senate; in his absence a senator is chosen president pro tempore. The upper house of the Canadian Parliament is also called the Senate; its 87 members are appointed by the crown for life. Hence—(*c*) In general, a legislative body; a state council; the legislative department of a government.

It is distinguished by the fruit, a didymous pod of which the rugose and nearly spherical valves separate at maturity into two one-seeded nutlets. There are 12 species, widely diffused through warm and temperate regions of both hemispheres. They are annual or biennial herbs, nearly prostrate and very much branched, bearing alternate entire or dissected leaves, and minute white or rarely purple flowers in short racemes opposite the leaves. *Coronopus Niloticus* of Egypt has been used as a salad, as has *C. Coronopus*, the wart-cress of England, also known as *swine-cress*, *herb-ivy*, and *buck's-horn*. *C. didymus*, the lesser wart-cress, a weed often covering waste ground in western England, is found naturalized in parts of the Atlantic States.

Cf. *sencion*.] **1.** A genus of composite plants, type of the tribe *Senecioneæ* and subtribe *Eusenecioneæ*. It is characterized by terminal flower-heads with a broad or cylindrical involucre of one or two rows of narrow bracts, numerous regular and perfect disk-flowers with truncate and cylindrical recurved style-branches and nearly cylindrical five- to ten-ribbed achenes, smooth or but slightly downy, and little or not at all contracted at the summit, which bears a copious soft white pappus of slender simple bristles. Some species have flower-heads calyculate with a few bractlets below, and the majority bear spreading pistillate rays, which are, however, minute in some and in others absent. This has been esteemed the largest genus of flowering plants, containing at least 1,000 clearly distinct species; it is yet uncertain whether or not it is surpassed by the leguminous genus *Astragalus*, under which 1,500 species have been described, but perhaps not over 900 of these are genuine. The species of *Senecio* are mostly herbs, of polymorphous habit, either smooth or woolly, and bear alternate or radical leaves which are entire, toothed, or dissected. Their flower-heads are either large or small, corymbed, panicled, or solitary, and are in the great majority of species yellow, especially the disk-flowers. The genus is of almost universal distribution, but the range of individual species is remarkably limited. They are most abundant in temperate climates; probably about two thirds of the species belong to the old world, and of these half to South Africa and over a fourth to Europe and the Mediterranean region. About ninety-five species are found in North America, twenty-three of which occur in the central and northeastern United States, the remainder in the southern and western parts of the continent. American species are much more abundant in the Andean region, where they assume a shrubby habit and in three fourths of the species develop no ray-flowers, the reverse of the proportion elsewhere. Many of the Andean species grow close to the snow-line, and have leaves quite glossy and glutinous above and clothed with warm wool beneath; some gummy-leaved species have been used for firewood by the Bolivians under the name *tola*. In St. Helena and New Zealand a number of species become small trees. (See *he-cabbagetree* and *puka-puka*.) (For the principal British and American species, see *ragwort*, *liferoot*, and *jacobæa;* for the original species, *S. vulgaris*, a weed sold for cage-birds in London under the names *bird-seed* and *chickenweed*, and also called *sencion* and *simson*, see *groundsel*1.) Several species have been in repute as remedies for wounds, as *S. Saracenicus* (for which see *Saracen's comfrey*, under *Saracen*). *S. paludosus* is known as *bird's-tongue*, *S. hieracifolius* as *hawkweed*, and *S. Lyallii*, of New Zealand, as *mountain-marigold*. *S. lobatus*, a tall and rather showy species of the southern United States, is known as *butterweed*, from its fleshy leaves. *S. Cineraria*, a bushy yellow-flowered perennial of Mediterranean shores from Spain to Greece and Egypt, is the dusty-miller of gardens, valued for its numerous long and pinnately cleft leaves, remarkably whitened with close down; from it the native dusty-miller of the Atlantic coast, *Artemisia Stelleriana*, is distinguished by its short, roundish, less deeply cut leaves. *S. mikanioides*, Cape ivy, a tender climber with smooth and shining bright-green angled leaves, from the Cape of Good Hope, is a favorite in cultivation. Several species are cultivated for their flowers under the generic name *senecio*, as the orange *S. Japonicus*, and the purple and yellow *S. pulcher*, which reach nearly or quite 3 inches in diameter. *S. argenteus*, the silvery senecio, a dwarf 2 inches high, is valued for edgings, and several others for rock-gardens. The most important species, perhaps, are those of the section *Tephroseris*, cultivated under glass, some of which have deep-blue rays, a color elsewhere absent from this genus as from most other composite genera.

2. [*l. c.*] A member of this genus.

senecioid (sē-nē'si-oid), *a.* [NL., < *Senecio* + *-oid.*] Resembling *Senecio*.

Senecioneæ (sē-nē″si-ō'nē-ē), *n. pl.* [NL. (Cassini, 1826), < *Senecio*(*n-*) + *-eæ.*] A tribe of composite plants, characterized by usually radiate flower-heads, nearly equal involucral bracts in one or two rows, pappus composed of bristles, anthers with a tailless base or with two short points, and penciled, truncate or appendaged style-branches in the perfect flowers. It includes 3 subtribes, of which *Liabum*, *Senecio*, and *Othonna* are the types, and comprises 51 genera and about 1,500 species, which extend into all parts of the world. They are mainly annual and perennial herbs with alternate leaves and yellow disk-flowers, often also with yellow rays. Among other genera, *Petasites*, *Arnica*, and *Erechtites* are represented in the United States.

II. *n.* [*l. c.*] A dealers' name of the small African blood-finches of the genus *Lagonosticta*. They are tiny birds, averaging under 4 inches long, and would be taken for little finches, but belong to the spermestine group of the *Ploceidæ* (not to *Fringillidæ*). More than 20 species of *Lagonosticta* are described, all African; they are closely related to the numerous species of *Spermestes*, all likewise African, and of *Estrelda* and its subdivisions, mainly African, but also Indian, some of which are known to the dealers as *amadavats*, *strawberry-finches*, etc. The blood-finches (*Lagonosticta* proper) are so called from their leading color, a rich crimson, shaded into browns, grays, and black, and often set off with pearly white spots. Several different birds share the name *senegal*. That to which it specially pertains inhabits Senegambia; it is the *sénégali* of the early French and the *fire-bird* or *fire-finch* of the early English ornithologists, the *Fringilla senegala* of Linnæus, and the *Estrelda senegala* of many writers; it is 3¾ inches long, the male mostly crimson, with black tail and brown belly, and the back brown washed over with crimson. *L. minima* is scarcely different, but slightly smaller, and has a few white dots on the sides of the breast.

1. In *psychol.*, the element of the perception or idea; an elementary mental process, conditioned upon a physiological process in a definite or local bodily organ: loosely, in literary usage, any mental process, perception, feeling, etc., which suggests a bodily origin. Most modern psychologists distinguish two classes of elementary mental process, the sensation, and the affection or the simple feeling. The former is at the root of our intellectual, the latter of our emotive and volitional experience. Sensations are classified as sensations of special sense (visual, auditory, olfactory, gustatory, cutaneous) and as organic sensations (kinesthetic, respiratory, alimentary, sexual, etc.). No approach to a final enumeration of the different kinds of sensation has as yet been made, though experimental investigation has brought to light some 50,000 distinguishable qualities. Sensations are also classified as peripherally and centrally excited, according as they are constituents of a sense-perception or of an idea.

Those that make motion and *sensation* thus really the same, they must of necessity acknowledge that no longer motion, no longer *sensation*, . . . and that every motion or reaction must be a new *sensation*, as well as every ceasing of reaction a ceasing of *sensation*. *Dr. H. More*, Immortal. of Soul, II. i. 12.

The perception which actually accompanies and is annexed to any impression on the body made by an external object, being distinct from all other modifications of thinking, furnishes the mind with a distinct idea, which we call *sensation*. *Locke*, Human Understanding, II. xix. 1.

Sensation, so long as we take the analytic point of view, differs from perception only in the extreme simplicity of its object or content. . . . From the physiological point of view both *sensations* and perceptions differ from thoughts in the fact that nerve-currents coming in from the periphery are involved in their production. *W. James*, Prin. of Psychology, xvii.

Impressions may be divided into two kinds, those of *sensation* and those of reflexion. The first kind arises in the soul originally, from unknown causes. *Hume*, Treatise of Human Nature, I. ii.

The feelings which accompany the exercise of these sensitive or corporeal powers, whether cognitive or appetent, will constitute a distinct class, and to these we may with great propriety give the name of *sensations;* whereas on the feelings which accompany the energies of all our higher powers of mind we may with equal propriety bestow the name of sentiments. *Sir W. Hamilton*, Metaph., xlv.

Unlucky Welsted! thy unfeeling master,
The more thou ticklest, gripes his fist the faster.
While thus each hand promotes the pleasing pain,
And quick *sensations* skip from vein to vein.
Pope, Dunciad, ii. 212.

sensationalist (sen-sā′shọn-al-ist), *n.* [< *sensational* + *-ist.*] 1. In *metaph.*, a believer in or an upholder of the doctrine of sensationalism or sensualism: sometimes used adjectively.

Accordingly we are not surprised to find that Locke was claimed as the founder of a *sensationalist* school, whose ultimate conclusions his calm and pious mind would have indignantly repudiated. . . . We consider this on the whole a less objectionable term than "sensualist" or "sensuist"; the latter word is uncouth, and the former, from the things which it connotes, is hardly fair. *Farrar*, Origin of Language, p. 150, and note.

2. A special sensation or group of sensations connected with a bodily organ; the mode of sensation awakened by the stimulation of a given type of sensory nerve-ending. In this signification, man is commonly said to have five senses—sight, hearing, smell, taste, and touch. A sixth sense is often specified as the muscular sense; a seventh is sometimes spoken of, meaning the inner sense, the common sense of Aristotle, an unknown endowment, or a sexual feeling. The seven senses are also often spoken of, meaning consciousness in its totality. Modern psychology distinguishes more than twelve senses, adding to the five mentioned above the senses of warmth, cold, pain, strain, dizziness, etc.

It is widely diffused through the tropics, native at least in South America and naturalized in the southern United States. The name is extended to other sensitive mimosas, as *M. sensitiva*, which is irritable in a less degree, and sometimes to the whole genus. — **Bastard sensitive-plant,** *Æschynomene Americana*. Another form of separator uses graduated screens, either flat or cylindrical, the cylindrical screens being made to revolve as the grain passes through them, and the flat screens having often a reciprocating motion to shake the dust out as the grain is passed over the screen. A recent form of separator employs cylinders of dented sheet-metal, the good grain being caught in the indentations and carried away from the chaff, which slips past the cup-like depressions. In still another form, the grain slides down a revolving cone, the round weed-seeds fly off by centrifugal force, while the grain slides into a spout provided to receive it. A variety of screens for sorting fruit and roots according to sizes are also called *separators*: as, a potato-*separator*. There are also special separators for sorting and cleaning barley, grass-seed, oats, etc. (*b*) In *weaving*, a comb-like device for spreading the yarns evenly upon the yarn-beam of a loom; a ravel. The vessel is filled with the mixture, and left at rest till the liquids separate mechanically, when the fluids can be drawn off by the cocks at their respective levels, or (in the form here figured) the denser liquid may be first drawn off completely through the stop-cock at the bottom, the narrow neck allowing the separation to be almost exactly performed.
